Subject: [X1M_QRP-Transceiver] Mod question

First off, WOW! I have never done anything this small before. Thank you Dale. If you didn't sell it for $11 I would've never tried it. Two questions: 1- what is the proper way to check to see if I bridged anything? 2- what is the other mod I need to perform on the radio when it comes in prior to completing this mod? Again, thank you Dale. If you've never done anything like this before, don't be afraid. Just be patient and take your time. Set up some at to easily catch dropped pieces. I did it once and it was the only time I almost cursed

2261. TX Audio Processor.

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-13 18:45:36 UTC
From: Bastress, David G
Topic: 2261 Message: 2261

GA All,

I wonder if would be possible to convince someone to build, or at least make the pc board, for the TX audio processor circuit that is on the users group site? Making it small enough to either fit in the microphone itself or inside the X1M would be nice.

Dave K3GAU

From: Dale Parfitt
Topic: 2263 Message: 2263

If someone on the list has the case off their X1M, would you accurately measure the outside diameter of the speaker?
I am looking into some mylar speakers that may offer us better and perhaps louder audio.

Tnx,

Dale W4OP

2264. Mods

I'm thinking of buying a unit bases on the reviews on this site.
My question is : why is that audio mod necessary, and if it is a malfunction why does'nt the manufacturer include in hi design.

Thanks 73

My X1M pro has a speaker diameter of 5 cm, as exactly as I can measure with my ruler. I'm sure I am less than a mm off, if that.... Yes, mylar speakers would be nice!

The audio on my X1M pro is pretty good without the mod, so I have made this modification on my X1M (I assume you are talking about the resistor bypass mod for increased audio). The final audio amp, the LM386, is very versatile and can be set up in various configurations. The factory took a conservative approach and limited the audio level (volume) with the 1K resistor. Testing, by knowledgeable group members who wanted more audio, found that simply bypassing this resistor increased audio levels by 12 dB. Prolonged use of rigs with this mod has not shown any issues arising from the mod, at least none have been reported here. So, those who prefer louder audio have made the modification. I have not, as of yet.

But now comes the twist... I understand that to take advantage of the ALC circuit Dale designed for the X1M, one needs to first do the resistor bypass mod... and I do want the ALC mod, so I guess I will make the resistor bypass mod to my rig.

Also, the audio output of the rig can be increased by increasing the diameter of the holes in the top that let the sound out. I re-drilled mine to 3/16 inch.

The mod is necessary because overall, the system gain is too low. Perhaps adequate for headphones, but very low with the internal speaker. If you wish to add AGC down the road, then the AF Gain mod is also essential.

Dale,

You are obviously a very busy business man and how you find time for these little projects amazes me but I am certainly happy you do because a lot of us would not have a clue how to make these improvements.
There are a bunch of talented members of this group and I'm sure glad you are all there to help the others of us get the most out of this fun little rig. Thank You All

The radios we have do not have a design problem in this particular audio issue . The mod is actually just that a modification that makes the audio amplifier factor more to the liking of most of us .

However that being said I believe it found enough favor among users that the company will likely include a different value for this part in the current run of these radios .

Last , the company has not made a production run of these radios since Dale found how to safely raise the gain , so this was discovered AFTER all of the radios CURRENTLY on the market or in use today were manufactured before the change recommend by Dale .

Please feel free to ask anymore questions , because I am a TRUE believer in this fine little radio . I may be a bit prejudice :) However I will ALWAYS give you an honest answer , along with what history I know about the radio or an issue , either way , good or bad , it WILL be the truth .

That agrees with the 50mm measurement. The speakers are ordered and will be here early next week.
I saw some chatter that said they made a big difference on the FT-817- so hoping for the same with our little rigs.

I have one on my MST-40 transceiver (www.ozqrp.com) and it sounds great. I want one for my X1M too. Where did you find yours? I would start with digikey if left to my own devices... The speaker on the X1M is not bad, but I have been very impressed with clear plastic cone (mylar) speakers.

Thanks for the suggestion.

I agree the speaker on the X1M is better sounding than I expected Lee . However I am like a kid in a candy store especially with this little radio and always looking to try something new and these sound like a nice improvement .

If I had a better working knowledge of sound and enclosures , I think an external speaker in a matching cabinet with whatever was required to bring out the sounds that we want to hear , maybe a small power supply and even a filter in it , would make an excellent addition to those of us that have plans to use the X1M as our primary QRP transceiver .

I have been using an FT-707S as my primary QRP station until now . It will still have a place on the bench because it is so reliable and fun to operate , but it will now take a backup position to the X1M , so that is why I am big on people designing and offering accessories so I can make it a miniature version of my QRO station which is a Kenwood TS-830S Gold Edition with all of the matching accessories , except the speaker and one day I'll find one of those that I can afford to add to the full desk station . Sure looks impressive to show off a station like that when someone comes to visit and I hope to reach the same point in miniature one day with the X1M .

I no longer have the tools or ability to use my brain , eyes , and hands to build factory looking projects , so I leave that to the people with those abilities and try to support them all that I can , and sometimes that is just buying one of their products .

Love to see ALL of the ideas flowing for this little radio . Keep up the good work , I for one appreciate it !!

Charlie, you are the heart of this group. I knew you from the techlib.com and part15 sites, and it was your recommendation that convinced me to buy the X1M... I am glad I did. This is a great group, not in small part due to your moderating/cheer-leading. As you said before, your opinions will always be fact-based and honest, but a little enthusiasm helps too. I hope the factory realizes what an asset this group is!

Stephen and Paul ,

Thank you very much for the information and I apologize for being so slow at addressing the issue . I have some projects that are pretty much a priority on my good days when I am able to get out and about without the cane and have an all around good day for me .
Like priority one right now , when it warms up some and no rain , I HAVE to get my antennas all finished for the entire winter . I need very badly to get my "full legal limit" Lowfer Beacon antenna up and operational . May sound silly to some "wasting" my time with 1 watt INPUT maximum legal limit power for the final fed into a maximum legal limit 15 meter long antenna on 1750 meters . But it is my real passion , the frequencies below 2 MHz. and I currently do not have a part 5 license to operate on any of the other bands down there . I would love to get on especially 630 / 600 meters . I have a "test antenna" that is only about 10 meters in length. The old beacon is on right now 24/7 running QRSS60 on 185.2984 kHz . At least I have a signal on the air and even on the test antenna it has been copied in the past at around 500 miles . My "goal" this season is to run some different modes with my brand new GPS disciplined transmitter and to hopefully add to my state count of the number of states it has been heard in and to exceed hopefully by quite a bit , my distances being heard . Currently close to 1700 miles is my personal best and 1500 miles is always a good capture when I am heard that far .
I do have a decent , not stellar , past history of a working knowledge programming in more than one language . I just can't be sure of how much of it I can still recall and how big and where the holes are in my memory related to it .
Just from my own "educated guess" at what I want to use the devices for , I believe that I want to go with Arduino . It appears capable and has devices available , such as sensors , for some of the uses that I have in mind using it for , at least while I am learning how to use it and working my way up to more specific and more advanced projects .
Any suggestions that anyone has as what I need to buy to get started would certainly be appreciated . I know I will need several "accessories" as I go along , which I plan on doing . I have a good stock of plain electronics parts , so what I am needing is Arduino specific bits and bobs that are needed to get started . An example is my first project(s) will be weather related , temperature , humidity and other things to get me started on a bigger "weather station." Then at that point I will know whether to venture out and try to build some of my own projects to add to my weather station , or if i need to still spend more time learning and building more "kits" or readily available simple designs out there .
ALL suggestions , will be GREATLY appreciated .

Hi Charlie,

I have to go out today but will consider your post later. I have a lot of stuff so don't buy anything until you hear from me later. I can certainly give you a small AD9854 DDS module which can be driven from an Arduino and a couple of temperature sensors. If you want to keep your costs down there are better options than the Arduino. For example http://www.element14.com/community/docs/DOC-54360 which, I guess, in the USA must be available for under $30. It has a whole bunch of sensors.

Anyway, must dash,

Steve

I am getting very interested in the world below 4 MHz now.

Thank you for the kind words Lee . It is the people that make this group so great . People especially like you , that share their talents for the benefit of everyone involved . Your inside the microphone speech processor is absolutely amazing and well worth people building one and making this addition too . I too agree that given the enormous popularity of this radio from the people that already own an X1M , that it would be a great enhancement to this group if a company Representative was a member of this great group.

It would be interesting to see the level of interest if you were to offer a board and a kit of parts for people to build one of your speech processors . (I am a very poor board designer)

There is a GREAT LONG TERM future for this radio , which is also exciting . The more of these that get out of the factory and into the hands of hams , I can see the company expanding its production numbers very substantially over the next couple of years . Their current sales are from what I can tell ,are primarily by word of mouth , which in my personal opinion is the best advertisement , but more advertisement through media advertising would expose it to many more people even more quickly . One thing for CERTAIN is this radio is going to be around for a LONG time!!!

If I was a younger person , I would be interested in being one of the USA service centers / Dealers for them .

I don't think that the company at first realized what a truly iconic radio they were producing . I think the reality of it is just now becoming clear to them that they have a long bright future with this ground breaking radio. Ed had great foresight and will likely need a larger dealer network to handle the sales of this radio . When I demonstrate it to someone , and some just give them an honest open , high and low point history of the radio to its present day version by phone and or e-mail , it sells itself . Yes I have even taken phone calls about the radio and the people were thrilled and enthused to get their hands on one after our conversation .

All of you guys even if you are like me and rarely make a club meeting these days , take it to a club meeting or even a hamfest and show them this little jewel , but hang on to it tight , people will be wanting to take yours home with them . <grin> When I took mine to a club meeting I was wearing a pair of cargo pants and had easily slipped the radio into one pocket so nobody knew I had even brought it to the club meeting . When the business meeting was over , I reached in my pocket and took it out . Not yet knowing what it was , once I put it on our operating table right next to our Icom HF rig and hooked it to the power supply and auto

tuner , people were beyond amazed and then when the first couple of contacts on 20 meters were DX stations they went wild !!

Don't keep it a secret , PROUDLY show it off and show them what it will do !! Our club people that previously could only afford VHF/UHF HT's , but always wanted to experience the thrill of HF all agreed that even on some of their very limited budgets , that they would now be adding the X1M to their Christmas list and could manage a few small cuts here and there to be able to buy such a fine little radio......

Changing the display and updating the firmware does upgrade the X1M version to the X1M-Pro.

Yes I have personally done it and it does indeed turn the early X1M into a PRO !! You get all of the new features and can make the firmware upgrades for the PRO anytime they are available . I have been using it for a month or two now , I lose track of time . Takes just a few minutes to do and you get the full band coverage in place of the shortened bands . Without opening the radio up and being familiar with all of the different models and boards , you can not tell the difference between the original and a PRO .

I was thrilled to see that the company didn't forget about the people that purchased the original . You will be quite happy with the change .

I can personally HIGHLY recommend ANYONE with an older model to do the PRO update !!

I forgot to add , that Ed now has a new cable for doing the firmware updates for the X1M . It is one single cable to go between the computer and the X1M and MUCH better than the earlier ones and also allows you to do rig control with HRD .

2291. Re: UK Calling - On Air.

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-14 15:41:44 UTC
From: m5zzr@btinternet.com
Topic: 2236 Message: 2291

A single CW frequency would do Dave, any band, variable from say 100mW
to about 1 or more watts. I don't need anything too technical.

On occasions I need a little RF in the workshop just to test, calibrate
or compare homebrew QRP meters and alike. I've looked at the Walford
transmitter kits which are cheap but none of them have variable power. I
suppose an old Ebay FM CB and a variable attenuator would do but
it's a bit clumsy and my workshop is small and overcrowded, then
again I suppose I could attenuate a Walford kit which might be neater?

The right thing will come along at some point, but thanks for the link.
There are some interesting projects there and it's always good to
know where the kits are. 73. Mel. M5ZZR.

qrpme.com has a number of transmitters that should work. My Super Tuna II Plus has a variable drive and will go from less then a 100mw to 2 watts. It's crystal controled with a VXO and you can build it for differant bands. In fact you can change bands with a plug in board. Last I checked the transmiter was 45 dollars.

For around $60 you can get an N3ZS DDS VFO kit. 1Hz resolution, variable tuning rates and good to 34 MHz. If you need higher freqs, just put a diode on the output. Need higher power- add a buffer amp.

Hi, Check out the Si570 DDS VFOs at www.sdrkits.net. They are made in the UK and, depending on the grade of Si570 you buy cover from 3.5 MHz to well beyond 1 GHz. The Si570 is widely used in the SDR community and has excellent performance. For the amplifier you could do worse than building one from EMRFD ..

I thought I recall that there was not enough memory in the micro for 100 memories- could be wrong though.

That is the same thing I remember , to accomplish all of the extra little changes that weren't actually a part of the original design the only place they could get the room to add them was to limit the number of memories to a total of 64 , 32 for each VFO .

I don't believe anyone has a change log of what actually is changed in the new batch , so we will all be finding out at the same time . There will be a firmware upgrade , but I don't believe it addresses adding any memories , because that was going to require a hardware change .

Like Dale , I might be wrong , but I believe that was the discussion and the reason .

2299. AGC KIT QUESTION

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-15 04:52:49 UTC
From: Charlie , W5COV
Topic: 2299 Message: 2299

Since Dale has shipped out all of the AGC kit orders , I was curious if the people that ordered them had yet put the kit together . If you have do you also have it installed ?

If it is installed how did you find building the kit and installing it ? Any problems or suggestions for those that may not have built theirs yet ??

Did you have any problems installing in and what are your overall impressions of it ? Do the attack and decay times seem like a decent set point ?

Feedback is always VERY important to see if you are happy with it and to find out if there are better or easier ways to do things in the future . Your experience building and installing it could benefit someone else or perhaps help all of us find an easier or better way to install it .

Is anyone having difficulty with it at any point in the process ? Don't be afraid to post a suggestion or a question on here . The goal is for you to enjoy the X1M even more .

I would certainly be interested in hearing from EVERYONE that ordered a kit and see what stage they are at with it . Please post and share your experience with the rest of us .

GOOD DX !!

This was my first time doing anything that small. I've done the pico keyer plus and pixie 2. It was intimidating for sure.
But, for $11, I said "oh well " and went for it.
I was very impressed with the ease and directions. No problems I'm aware of. I didn't even curse once.
I'm waiting for the new shipment to come in. So I can't comment further. Only that if you haven't done anything like it before, try it. Think small iron. Small solder (.011). And take your time. Be sure to setup some type of catch system so you don't drop parts on the floor.

2301. Internal Microphone Conditioner Update

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-15 15:05:44 UTC
From: <mr.olson@...>
Topic: 2301 Message: 2301

Here is where I am so far on getting the SSM2167 working inside the stock microphone. Even after disconnecting the LED there is not enough power in the Microphone. I understand there was a discussion changing a resistors value in the radio to get more current. That is not the issue because there is another problem I do not know how to get around it. I uploaded 2 pictures to my N9LO photo folder. The first is a diagram showing where my problem is and the second is from my oscilloscope. The circuit works when switched to the uncompressed position but when in the compressed position I think the signal is going back down wire "A" and through the 1N4148 back to the Microphone. The 1N4148 was used to try to keep the electret microphone audio from getting back to the Tip on the microphone plug. You might think there would be a feedback situation but oscilloscope picture looks like the compressor output is 180 degrees out of phase canceling the audio, I think. I am stuck and need some help from anyone with more knowledge than me. and since I am just a hobbyist there are a lot of you out there. So this part is on hold but I purchased a CB type power microphone on eBay for $16 that uses a 9 volt battery inside. I plan on replacing it's amplifier with a SSM2167 circuit like my external version. Besides that larger microphone fits my big hand better. I may use the stock microphone cable because it is a lot more flexible and the power microphone cable is a little fat for the X1M plug.

Hi Lee, I'll take a look at your diagrams, but I'm not sure I'll be of much help. I took a simpler,approach to the project and built a stand alone mic with 2 AAA batteries in the enclosure. As a result, the microphone is larger than I would have liked. I'll post a picture. It has 2 external potentiometers, one to adjust the compression (ratio of 1 to 6) and one to adjust the audio drive. It is far from professional looking, in fact it is borderline ugly, but it does work. Who knows what difficulties I might have encountered if I had been more ambitious in my design.

The other Lee ;-)

You know, looking at the pictures, my circuit should have the same issues as yours, but it doesn't. I see 2 differences, other than the power source. First, my output cap is after the attenuator whereas yours is before. Second, I used a 3.3 K resistor to bias the electret microphone in the place you have a diode. The electret needs a resistor between it and the positive rail to power/bias the FET built into the cartridge. I have never seen a diode used for this purpose. Try substituting a resistor for the diode. I'll look more closely later, my XYL has a schedule for me right now... ;-).

We will upgrade/revise the user's guide when I can get my replacement X1M with the new firmware. If the screens have changed, I would be deeply appreciative if someone could send me new photos. Also, I'll put in the new "default" values in the list, and address the new RS-232 to USB converter cable (I have one on order with the return of my replacement X1M).

Are there any other issues that need to be addressed in the new firmware?

I am like the cat who ate the cheese and sat by the mouse hole with baited breath...

GM Lee,

I have a question. Have you tried connecting the mic element directly to pin 5 of the chip without the cap and diode? According to the chip data sheet there is approx. 0.4 vdc on that pin. I am not sure if that is enough to make the mic element work or not. If it is you could eliminate the cap and diode.

OR, the idea given by the other gentleman might also work. OR, possibly splitting the 3.3 K into two resistors of 1.5k or 1.8 K each and putting a cap ().1 UF or better) from the junction of the two resistors to ground. that give the mic the same voltage but keep the audio from passing through.

Just some possibilities. FWIW.

With more time for consideration (I wish I could delete posts that make me look as foolish as I sometimes am ;-) your circuit and mine differ in the way you pointed out. My chip and electret power are isolated from the audio output. Yours run on the same line, hence the diode. I still think the bias resistor for the electret may be important.

As a result, the microphone is larger than I would have liked. I'll post a picture. It has 2 external potentiometers, one to adjust the compression (ratio of 1 to 6) and one to adjust the audio drive. It is far from professional looking, in fact it is borderline ugly, but it does work. Who knows what difficulties I might have encountered if I had been more ambitious in my design.

The other Lee ;-)

---In X1M_QRP-Transceiver@yahoogroups.com, <mr.olson@...> wrote:

Here is where I am so far on getting the SSM2167 working inside the stock microphone. Even after disconnecting the LED there is not enough power in the Microphone. I understand there was a discussion changing a resistors value in the radio to get more current. That is not the issue because there is another problem I do not know how to get around it. I uploaded 2 pictures to my N9LO photo folder. The first is a diagram showing where my problem is and the second is from my oscilloscope. The circuit works when switched to the uncompressed position but when in the compressed position I think the signal is going back down wire "A" and through the 1N4148 back to the Microphone. The 1N4148 was used to try to keep the electret microphone audio from getting back to the Tip on the microphone plug. You might think there would be a feedback situation but oscilloscope picture looks like the compressor output is 180 degrees out of phase canceling the audio, I think. I am stuck and need some help from anyone with more knowledge than me. and since I am just a hobbyist there are a lot of you out there. So this part is on hold but I purchased a CB type power microphone on eBay for $16 that uses a 9 volt battery inside. I plan on replacing it's amplifier with a SSM2167 circuit like my external version. Besides that larger microphone fits my big hand better. I may use the stock microphone cable because it is a lot more flexible and the power microphone cable is a little fat for the X1M plug.

Hi Lee,

I have spent about zero time looking at this, but I have some observations.

The X1M has +5VDC through a 3.3K (?) resistor to the tip. Your IC would like to see 3V minimum and will draw about 3mA. So with the stock resistor in the X1M you will drop the entire 5VDC across that reistor if the chip draws 3mA- so that can't work. Plus you need to isolate the audio from the Vcc.
I think you might try sending the regulated 9VDC to the tip through a 1K resistor. Inside your mic place another 1K resistor to pin 10 of the IC.
On pin 10 put a 10uF and a 0.1uF cap to ground to strip off noise, audio and to stiffen Vdd. So you have 9VDC through a pair of 1K resistors to the IC drawing 3mA. That leaves you 3VDC at the IC (assuming the 3mA is typical.

Ignoring the compressed/uncompressed switch:
The output impedance of the IC is quite low (under 200 Ohms?) so you can capacity couple it back to the junction of the two 1K resistors. The IC won't see the output audio beacuse you have the low pass filter comprised of the 2nd 1K resistor and the caps on Pin 10. All the other Vdd pins on the IC also connect to pin 10 thropugh whatever resistors the datasheet recommends.
You can't feed the electret with 0.4VDC as someone else suggested. The electret mic element not only contains the electret mic but also a voltage follower- usually a JFET. This is there to step down the extremely hi impedance of the electret element to something well under 1K. That JFET transistor needs 3 V or so to operate- at very little current. Feed the electret element with a 2K or so resistor also from pin 10 of the IC.

I'll try to do a schematic later if needed.

Thanks to all that replied. I was trying to get away from modifying the radio so that is why I am going to try and modify a 9 volt power microphone. It has a 10K potentiometer built in. Dale, I see that impedance thing is biting me again, lol. I would like to see your schematic when you get time. Not just for me but for others pursuing this too.

Hi Lee,
Let's see if Yahoo will pass on my schematic. Modifying the radio would be very easy. Just remove the 3.3K SMD and tombstone a 1K SMD. The top end of the 1K then goes over to any one of the 9VDC points.

The jist of the schematic is that through proper selection of the value of the 1K internal and the 1K going to pin 10, you end up with 4VDC at pin 10. The two caps to ground decouple that point making it into a nice noise free, stiff +_4VDC. Now you can connect your series resistor to the mic to this point. The 2.2K resistor makes sure the mic element is not at a signal ground level (note that the 4VDC is also at signal or AC ground).

I did not look at your output configuration on pin 9, but be aware it forms a high pass filter (the 5.6K and the 100nF series cap) and may limit your low frequency response. Just something to look into.

Then again, you have spent a LOT more time with this than I have- and I could have missed soemthing very basic. Comments/corrections welcome.

First, I would like to thank Roger N4HSI for showing us his SMD holder. I searched the internet and found some other examples that motivated me to make my own. The board is a $1 cutting board from Dollar Tree. The light, for my old eyes, is from eBay for $1.88. It is USB powered and I use a spare USB wall charger. My holder works similar to an old spring style clothes pin. Everything else I had lying around including using a pen spring for tension. A piece of upside down mouse mat keeps the circuit board from sliding around like Roger N4HSI did. The first time I used it I wondered how I got along without it. I put some pictures of it in my N9LO photo folder.

Hi all,

I spent a good portion of Sunday tweaking and testing the circuit with another ham. The short of it is I still don't have a final set of values I'm really happy with but boy am I learning a lot! Swapping in and out parts and seeing how it changes on the screen of the computer is fascinating!

Lee - at one point you mentioned you measured the output of the oringal mic at 40mV. Can you tell me how you did that measurement? I have a trimmer on the output and am calibrating it for the comptuer I'm working with before the radio but I suspect I'm going to have to adjust it f or the radio again -- so I want to reproduce and use your method to start. Thanks.

With that I'm chugging along.....

---In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:

Success #2!!!! I've got my prototype compression circuit working tonight! Lee -- thanks for your diagram -- I didn't realize I needed to bias the microphone -- although I had wondered how the voltage was going to get there. Turns out my suspicion was correct -- and your diagram told me the answer to my questions! So thanks for that! The other piece I needed to change was the 3v cell button battery out for a 5vc supply with more amperage available.

So at this point I'm getting output and I'll start working on tuning the core feature set and then work on improving it etc. And this rig is still tickling me pink! Giving me reasons to learn :)

Hi Lee,

Measure exactly what your current drain is and change out the resistor that is in series with the 9T voltage that is impressed on the mic socket.

As Charlie pointed out, it is currently 3.3K at least on the schematic.

On 10/28/2013 3:54 PM, lphebus@... mailto:lphebus@... wrote:

I have posted an improved microphone with compression circuit in the photos section, "compression circuit" album. The advantage over the original design is that the compression chip is only active (~3mA current draw) when the mic is keyed. When the mic is not keyed, the chip goes into shutdown mode drawing <2 micro-Amps. My design is a battery-powered (2X AAA) replacement microphone, not a modification of the existing mic or X1M. The circuit mod should greatly extend battery life and allows elimination of the on/off switch.

---In X1M_QRP-Transceiver@yahoogroups.com mailto:X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> mailto:x1m_qrp-transceiver@yahoogroups.com wrote:
I've bread boarded and tested an audio compressor circuit. Pictures are in the "Photos" section. Compression is adjustable from 1:1 to 6.25:1 which seems like plenty to me. It really helps the audio "punch" of the X1M. My plan is to put the circuit in the microphone case with a couple AAA batteries for power. I thought I would use a design like this http://www.qrpkits.com/microphone.html http://www.qrpkits.com/microphone.html . I tried to power it from the +5 volts the socket provides for the electret microphone, but the compressor current draw, although small (<3mA), loaded the 5V down to about 1.7 V. I am surprised by this. The AAA batteries should last a long time however. There are two potentiometers (blue) in the bread boarded circuit. The left is the compression level (Rcomp) and the right is the attenuator adjustment. The output of the compressor chip is a bit too high to feed directly into the X1M.

Great attitude, Chris! I'm not familiar with that IC, but it sounds as though it has the functions you are seeking. Reasonable compression will add substantially to your "talk power." Like most things, it can be overdone and degrade your signal. Sounds as though you are tackling the learning opportunities this little rig offers with zest and enthusiasm. Have fun and enjoy the trip!
Ken, W1KRT

--- In x1m_qrp-transceiver@yahoogroups.com mailto:x1m_qrp-transceiver@yahoogroups.com, <orders@... mailto:orders@...> wrote:
Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about

this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

Lee / 7 and Lee / 9 , I always enjoy reading your posts and those of all of the other people doing design and building . That SMD homemade parts holder is certainly a GREAT idea , especially in my case . So simple and clever I appreciate Roger so kindly sharing that with us old fellows :) I wish I had had one for the past couple of years anyway !!

Believe me I should be the President of the club of wanting to be able to retract some e-mails that seem foolish to even me after a while or sometimes as soon as I hit the send button , but this great group is very tolerant and has put up with my posts , that like this one are often far too long . Being an old bachelor that is mostly homebound , this group is a part of my family and a LARGE part of my contact with the outside world , so I tend to be long winded . I apologize to those that endure reading my complete e-mails :) I know I can bore people to death , but the net and this group in particular is pretty much my social life . I am trying to cut down on the number and size of my posts .

Guys if you have ANY problems working with SMD parts then this parts holder that Roger shared with us is an ABSOLUTE MUST addition to ANY bench , I think even for the guys that don't have the problems that some of us do . If anyone else has similar hints and kinks that they are willing to share with the group , PLEASE post them . I am always looking for new , better , easier , faster ways to do something that I can put together at home . The simple suggestion by Dale in the instructions for building the AGC board of placing a piece of white paper under the work area is extremely valuable when you inevitably drop one of those parts .

We are so blessed and fortunate to have Dale as an active member of this group . We can ALL learn from him . I find everyone that builds something , that I learn something from their design , method , device , or the troubleshooting of it to make it work properly . Dale sacrifices a LOT of time from his actual business to freely help us , so we should all keep that in mind when we shop for a product that his company produces !!!

He is a pioneer in several antenna endeavors and I for one can HIGHLY recommend his HF Omniangle antennas . They work VERY WELL with the X1M and there is more than one HUGE selling point for them . First I absolutely love it being a true omnidirectional horizontally polarized antenna , no having to have the dipole oriented just right , or have to quickly rotate an antenna to grab a DX station that just comes up . You can work him , while the "big guns" are still trying to aim their beams !! No expensive rotor to buy or worry about it working on a really cold winter day like we have plenty of coming up . Amazingly this antenna can be put together with ONLY A PHILLIPS SCREWDRIVER !! I have pretty

limited use of my hand and it took me all of 15 minutes to assemble it . Here is one of the best parts , I usually have to even hire someone to hang a simple dipole for me and I have never managed to assemble one of those in 15 minutes either and with only a single tool . I put this antenna up all by myself also in less than 15 minutes . It weighs in at under 3 pounds , but excellent design and superior materials convince me that it will indeed withstand the 90 + per MPH winds that I experience at this QTH . Put it on the already set and empty push up pole hooked up the feedline and managed to get the pole extended all by myself on one of my really good days and with the guys already set for the pole to be extended the Omniangle was ready to go on the air from its 30 foot height in less than 15 minutes . I am adding new stations to the log daily , DX is sometimes easier than many stateside stations !!

I agree with you 100% Mike . It works very well with the X1M , so if you already own one it is a GREAT addition to put on your Christmas list . The size is great too since it was designed by Xiegu to go along with the X1M. Also like you said it works quite well with ANY radio . I too have an FT-857 that is bare bones with no filters or options and it REALLY makes a world of difference on that rig !! A great addition and buy in my opinion .

It is also on sale now just in time for Christmas :) here is the URL if you are interested. Look under Xiegu Technology in the box on the upper left corner of the page or search for audio filter in the search box .
http://www.importcommunications.com/

The FRONT PANELS to upgrade the earlier X1M's to a full fledged PRO , are on the Xiegu page also. I have tried one and have been using it for about 2 months on an original X1M and there is absolutely zero difference between the upgraded original and the PRO .

I really like the light addition that you made to yours Lee . I am going to have to add a small diameter magnifier to mine . I HAVE to have PLENTY of light and magnification to work on almost anything , even larger parts . I need to search around a little and see if there is a CHEAP small diameter lighted magnifier . Not going to spend much on one , because I can find some way to rig a small lighted magnifier put together out of common parts . Still trying to stock up on 1206 and 1210 parts that I use a lot of . However I now have a lot more confidence in using 0805 on occasions .

Another aid in my personally doing 0805 size work is Dale told me about some Kester .015 solder on eBay . I have been and still do use on other parts , Radio Shack (64-013) .022 solder. Just the small diameter difference moving down to .015 has been a help too on working on the 0805 parts . That is pretty much my bottom size for parts and it isn't going to get any better the older that I get .

So I have finally got my AGC kit yesterday and found some time today getting all those tiny little parts together. OMG is it tiny! Without magnifying glasses I would have been lost...
Getting the 4.17 volts at the testing point is a little bit difficult because the linear pot is very sensitive. There is a big difference with the AGC and using the radio is now much more comfortable.
One annoying thing appears each time I turn on the radio I have to wait about 10 sec until it has reached its final sound volume. It´s like a tube radio warming up.
Maybe this is related to the fact that I built the kit with the 10 M option for resistor R4.
Is this a regular behavior or did I mess up some of those tiny little parts?
BTW there is a little typo in the part list with 2 times C2.

Hi Andy,
There really isn't anything magic about the 4.17VDC- it sets the AGC threshold and someone might like a higher or slightly lower threshold.

My rig comes up immediately. I did see slow startup on some previous circuits, but not this one. I am also using the 10M timing resistor.
Let's see what others are experiencing. I'll correct the parts list, but I am not seeing the C2 error- can you give me some more detail?

Tnx,
Dale W4OP

My error guys. I have a 1M installed in my circuit! I did have a 10M and 1M in the proto board- and may have missed the slow start up with 10M.
So builders alert- use the 1M (1004 marked on the resistor).
Unfortunately, I have taken the proto circuit apart, so I can't confirm the slow start up with it. I would not think there would be any different specs between the surface mount IC and the DIP I used. The only other thought might be the nonpolarized cap used in the kit at C3 vs. the electrolytic in the proto.

End result is that the 1M sounds great. Sorry for the confusion

You're welcome Andy. For a quick fix you could just add the 1M SMD on top of the 10M.
This would not have happened if we still had color codes!

Subject: [X1M_QRP-Transceiver] Strange behavior after AGC update

So I have finally got my AGC kit yesterday and found some time today getting all those tiny little parts together. OMG is it tiny! Without magnifying glasses I would have been lost...

Getting the 4.17 volts at the testing point is a little bit difficult because the linear pot is very sensitive. There is a big difference with the AGC and using the radio is now much more comfortable.
One annoying thing appears each time I turn on the radio I have to wait about 10 sec until

it has reached its final sound volume. It´s like a tube radio warming up.
Maybe this is related to the fact that I built the kit with the 10 M option for resistor R4.
Is this a regular behavior or did I mess up some of those tiny little parts?
BTW there is a little typo in the part list with 2 times C2.

Andy, DC3AFA

2327. RE: Strange behavior after AGC update

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-16 18:36:46 UTC
From: <andreas.fuehrmann@...>
Topic: 2318 Message: 2327

Seems as if my msg didm´t make it through the Yahoo system...
Changed R4 from 10m to 1M (labeling is NOT 1004 but 105!) , had to reduce voltage to 3.09 V. Now there is only a slight delay of about half a second left. Nice!
Thanks again, Dale!!!

Andy, DC3AFA

Hi Dale,

and tnx for your quick response. It´s a great kit anyway. I will do some testing with the settings of R1.

tnx for your great support,
Andy, DC3AFA

---In x1m_qrp-transceiver@yahoogroups.com mailto:x1m_qrp-transceiver@yahoogroups.com, <parinc1@...> wrote:

☐ Hi Andy,
There really isn't anything magic about the 4.17VDC- it sets the AGC threshold and someone might like a higher or slightly lower threshold.

My rig comes up immediately. I did see slow startup on some previous circuits, but not this one. I am also using the 10M timing resistor.
Let's see what others are experiencing. I'll correct the parts list, but I am not seeing the C2 error- can you give me some more detail?

Tnx,
Dale W4OP

Bingo! Changed 10 M resistor against 1 M (it is labeled 105 not 1004), had to reduce voltage down to 3,09 Volts, too. Now it is working nicely. Startup is only delayed slightly - about half a second - but that´s o.k. for me!
Thanks again, Dave. Great work!

2333. Re: [X1M_QRP-Transceiver] AGC KIT QUESTION @Mike

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-16 21:57:31 UTC
From: Charlie , W5COV
Topic: 2333 Message: 2333

Mike this kit is a real step up from those kits . I guess more correctly step down :) as it takes even experienced guys with lots of SMD skill patience and precision work to complete .
I should have done this earlier , but I wanted to congratulate you on taking the plunge and building it.

We need more people like you in our hobby today . Many of us in this group are getting a little above middle age :) Please pass your age along and tell us a little about your history in the hobby.

I am 60 years old and just this month mark my 48th anniversary as a ham . I know Dale is a couple of years older than me and was licensed , like I was , at a young age ,so he and I have very close parallels of experiencing ham radio and it transformation over the same years . I was age 12 when my license actually arrived . I think I was age 11 when I passed the test . Things in those days didn't move very quickly , no on the spot instant upgrades . I remember when I had to go to the FCC office for my upgrades through Extra and even then after passing the morse and written test in front of an FCC examiner , he told me to expect my license in the mail in about 12 weeks and naturally I couldn't even operate at the higher class until I had it actually in hand.

If you can handle this kit , you are ready to move on to some more complex projects to build . If you ever have ANY questions , please DO NOT HESITATE to post them to this group. It is one of the best , most "user friendly" groups around for helping people . We have Dale and several people who have different areas of knowledge , in the electronics field . Also if you find yourself in need of a part or even a few for a project , don't hesitate to post it on here . I keep a wide variety of parts on hand and am always willing to share if they will help anyone . You can manage to collect a lot of things in half a century :)

I personally have no knowledge of the expected shipping date , but I hope it is soon , so you can get on the air and both enjoy and appreciate the fine features of this true little radio now . I look forward to working you when you get your radio . With this batch maybe we will have enough people to actually start us a little weekly get together of X1M users on the air .

Again CONGRATULATIONS !!

Thanks Charlie. I'm one of those who read your entire post and there's no need to apologize.
I'm 43 years old. I received my license 4/94. First as a Tech plus after only study the material and code for a week.
I later upgraded to General.
Besides being proud of myself for stepping "down" on this kit, it was also a hurdle because of an injury I sustained at work (as a professional firefighter) causing me to lose sensation in the tips of my fingers.
I do have one question. If you could be as descriptive as possible, what pins do I test for the 4.17 volts after installing?
This kit has been the catalyst for me pulling out the old pixie 2 and consider some mods to improve it.
I love qrp and owned one of the first kx3's. Like I've said before, Elecraft has unbelievable customer service. Their yahoo group is pretty amazing to. That is what has me so excited about this radio. This group, Dale and Ed have been amazing.

Ok! So I built the mod with the 10m as recommended. I don't think the delay will be a issue for me if it's just a "warm up" scenario. What do you recommend is the optimum setup?

Hi Mike,
Both the schematic notes (in the manual) and page 6 of the manual direct you to measure the 4.17VDC at pin 5 of the MC1350. That is the leg you will be lifiting on the MC1350 IC

Hi Mike ,

Dale is of course spot on , once you make the cut , you will know where you are supposed to be . Since you haven't yet seen the inside of an X1M yet , the chip is also easy to locate . There are only two full size DIP's on top of the top board . The one on the outside edge is the LM-386 and the one next to a couple of crystals kind of in the middle of the board toward the front , is the MC1350 . So any of the chips you will be working with are pretty easy to identify .

I am looking into why the decay is longer with the kit than what it was with the proto board. I used the 1M and it sounds fine.

Dale

Ok! So I built the mod with the 10m as recommended. I don't think the delay will be a issue for me if it's just a "warm up" scenario. What do you recommend is the optimum setup?

Changed R4 from 10m to 1M (labeling is NOT 1004 but 105!) , had to reduce voltage to 3.09 V. Now there is only a slight delay of about half a second left. Nice!

Thanks again, Dale!!!

You're welcome Andy. For a quick fix you could just add the 1M SMD on top of the 10M.
This would not have happened if we still had color codes!

Hi Andy,
There really isn't anything magic about the 4.17VDC- it sets the AGC threshold and someone might like a higher or slightly lower threshold.

My rig comes up immediately. I did see slow startup on some previous circuits, but not this one. I am also using the 10M timing resistor.
Let's see what others are experiencing. I'll correct the parts list, but I am not seeing the C2 error- can you give me some more detail?

Tnx,
Dale W4OP

So I have finally got my AGC kit yesterday and found some time today getting all those tiny little parts together. OMG is it tiny! Without magnifying glasses I would have been lost...

Getting the 4.17 volts at the testing point is a little bit difficult because the linear pot is very sensitive. There is a big difference with the AGC and using the radio is now much more comfortable.
One annoying thing appears each time I turn on the radio I have to wait about 10 sec until it has reached its final sound volume. It´s like a tube radio warming up.
Maybe this is related to the fact that I built the kit with the 10 M option for resistor R4.
Is this a regular behavior or did I mess up some of those tiny little parts?
BTW there is a little typo in the part list with 2 times C2.

Andy, DC3AFA

2341. NEED A STATE FOR WORKED ALL STATES THIS WEEKEND ??

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-17 00:09:46 UTC
From: Charlie , W5COV
Topic: 2341 Message: 2341

DARN !!! I HATE getting old and the swiss cheese memory issues !!!! I CAN NOT believe I missed the opening part of the ARRL PHONE SWEEPSTAKES !!!

Guys it is happening NOW !!! This is probably the best activity of the year for you to pick up states , sections and counties that you might need if you collect paper , for any of the bands covered by the X1M . The WARC bands aren't allowed in contests , so you have the same set of bands available as everyone else !!

I don't believe I have ever missed operating any of the SS in 48 years . This year I am going to be doing a LOT of hunt and pounce , since I reset my logbook to ALL zero contacts back the first of the summer , so I need a LOT of states on SSB on different bands to add to my numbers . I am just like a beginning ham on totals , that got their license the first of the summer .

Get your MICROPHONES out and work EVERY state and section in the USA !! This may be the BEST opportunity that you will have this year !! Believe it or not I was VERY surprised in the CW Sweepstakes two weeks ago at what you would have thought would have been very easy states turned out to be the most rare for almost everyone . I saw that Arkansas , was I believe the most wanted , least worked state during the CW portion. Believe me in this particular contest , EVERY state and section is needed by someone and it just may be yours , you never know !! I only live 80 miles from Arkansas and should have made a nice fall weekend trip over there with the X1M to operate on phone . But if I had done that Oklahoma , where I live would have been the "rare" state or Kansas , that I live a half mile from , and have a nice radio club station on top of a high hill over there .

Okay guys starting at zero here for sections for the Sweepstakes , sure would like to have a clean sweep by tomorrow evening . Get on and lets see how many we can work !!! We might "make a LOT of peoples day or entire weekend !!!" (Exchange info at www.arrl.org)

Subject: [X1M_QRP-Transceiver] Strange behavior after AGC update

So I have finally got my AGC kit yesterday and found some time today getting all those tiny little parts together. OMG is it tiny! Without magnifying glasses I would have been lost... Getting the 4.17 volts at the testing point is a little bit difficult because the linear pot is very sensitive. There is a big difference with the AGC and using the radio is now

much more comfortable.
One annoying thing appears each time I turn on the radio I have to wait about 10 sec until it has reached its final sound volume. It´s like a tube radio warming up.
Maybe this is related to the fact that I built the kit with the 10 M option for resistor R4.
Is this a regular behavior or did I mess up some of those tiny little parts?
BTW there is a little typo in the part list with 2 times C2.

Andy, DC3AFA

Ok! So I built the mod with the 10m as recommended. I don't think the delay will be a issue for me if it's just a "warm up" scenario. What do you recommend is the optimum setup?

Seems as if my msg didm´t make it through the Yahoo system...

Changed R4 from 10m to 1M (labeling is NOT 1004 but 105!) , had to reduce voltage to 3.09 V. Now there is only a slight delay of about half a second left. Nice!

Thanks again, Dale!!!

You're welcome Andy. For a quick fix you could just add the 1M SMD on top of the 10M.
This would not have happened if we still had color codes!

Hi Andy,
There really isn't anything magic about the 4.17VDC- it sets the AGC threshold and someone might like a higher or slightly lower threshold.

My rig comes up immediately. I did see slow startup on some previous circuits, but not this one. I am also using the 10M timing resistor.
Let's see what others are experiencing. I'll correct the parts list, but I am not seeing the C2 error- can you give me some more detail?

Tnx,
Dale W4OP

I just got my AGC Kit Saturday Hope I have time Monday to put it together and see how it works.
I have been working on 17 meter all weekend just taking me back to the old day when.
I had a HW8 and a HW16. Remember the good old days. an how I mod my hw16 and how much fun I had. Hope this give the same fun I had then.

Hi Gary ,

Yes I still have an HW8 and HW16 that were my QRP/QRO CW rigs before I ran across a Yaesu FT-707S that wasn't working . It was cheap and is also only designed for 10 watts and had the WARC bands . I fixed it and it has been the great regular rig here until this X1M came out .

Now the X1M brought me new excitement and I enjoy operating it .With the AGC board , I also have the matching filter for the X1M . 17 meters has become my favorite band over the last year and I run one of Dale's Omniangle antennas on it and work everything I want to . So I have a nice 17 meter setup here .

30 meters is my second favorite place to hang out .

Hope to work you on 17.

2348. RE: AGC KIT QUESTION

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-18 01:28:23 UTC
From: <wkpres@...>
Topic: 2299 Message: 2348

The AGC kit from Dale has been completed, installed, and is working exactly as described. I am more that pleased with the result.

Although, I must say, now that I have reached 67, it seems that those SMD parts have gotten even smaller than I remember. Still, the kit went together nicely, and I settled on the 1 MOhm value for R4.

The SMD technology, as many have noted, is a bit of a challenge, especially for some of us "older" guys who don't see as well as we used to. I fabricated an SMD part holder using a section of metal coat hanger and a piece of 1 x 12 for a base. The metal has enough "spring" so that with a modest arch, a 10-12 inch section bent into an arch provides just enough pressure on the part and pc board to hold them while I solder, and the arch in the section of coat hanger can be increased or decreased to give just the right amount of pressure to hold things still. It is certainly not the most attractive, but it worked like a champ. I soldered with a WLC100 set on "3", and equipped with an ST-1 tip. I used the .020 solder, which is a bit larger than what some other folks are using, but it works well for me. A cheap, jeweler's lighted magnified visor from Amazon compensated for my 67 year oild eye's lack of clarity.

As you can see, none of my setup is what you would call expensive, but it gets the job done.

I guess you will get a reply from Dale shortly, letting you know about the supply situation..

My kit arrived in the mail here in Australia today, thanks. One strange result though. Somehow in the order process I was annointed with a new first name, "Walter". Now, Walter Maxwell rings a bell but I don't think my fame will ever equal his. Are you are manitaining a database of kit purchasers, Dale? If so, might be best to give me back my name "William" so we can let Walter rest with his :)

2351. Walter Maxwell and the AGC Kit

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-18 02:19:32 UTC
From: Dale Parfitt
Topic: 2351 Message: 2351

That's pretty good Bill- consider it an "upgrade".

I think what happened was we had just shipped some filters to a Walter Maxwell, and I still had that on my mind.

Or, it could just be a sign of impending feebleness.

As for the AGC kit, I am sold out, but looking at one of our members from OK to pick up the next round. Stay tuned.

Dale W4OP

I guess you will get a reply from Dale shortly, letting you know about the supply situation..

My kit arrived in the mail here in Australia today, thanks. One strange result though. Somehow in the order process I was annointed with a new first name, "Walter". Now, Walter Maxwell rings a bell but I don't think my fame will ever equal his. Are you are manitaining a database of kit purchasers, Dale? If so, might be best to give me back my name "William" so we can let Walter rest with his :)

Subject: [X1M_QRP-Transceiver] RE: AGC KIT QUESTION

The AGC kit from Dale has been completed, installed, and is working exactly as described. I am more that pleased with the result.

Although, I must say, now that I have reached 67, it seems that those SMD parts have gotten even smaller than I remember. Still, the kit went together nicely, and I settled on the 1 MOhm value for R4.

The SMD technology, as many have noted, is a bit of a challenge, especially for some of us "older" guys who don't see as well as we used to. I fabricated an SMD part holder using a section of metal coat hanger and a piece of 1 x 12 for a base. The metal has enough "spring" so that with a modest arch, a 10-12 inch section bent into an arch provides just enough pressure on the part and pc board to hold them while I solder, and the arch in the section of coat hanger can be increased or decreased to give just the right amount of pressure to hold things still. It is certainly not the most attractive, but it worked like a champ. I soldered with a WLC100 set on "3", and equipped with an ST-1 tip. I used the .020 solder, which is a bit larger than what some other folks are using, but it works well for me. A cheap, jeweler's lighted magnified visor from Amazon compensated for my 67 year oild eye's lack of clarity.

As you can see, none of my setup is what you would call expensive, but it gets the job done.

The AGC kit will work with any X1M version , however the audio gain mod must be done also .

How many people are currently interested , just to start getting an idea , in getting an AGC kit ?

We still also need to actually get one of the new run of PRO's in someones hands that can tell us whether or not the factory did indeed implement the audio mod in this production run .

Thanks ,
Charlie , W5COV

Nice job on the AGC kit, Great quality board, silkscreening and mask. It went together easily with no issues. Only one major problem.....I have the board completed, I guess I should order the radio to put it in! I have been waiting until the next batch is received and comments made, to see if suggestions have been implemented. it is getting harder and harder to hold off ordering, you guys sound like you are having a blast with it.
Anyway, thanks again for all the effort that was put in to design this nice addition to the radio.

2360. Member Intro's

With an expected influx of many new members when this shipment gets to its respective locations , I myself and I think most people like to get to know a little about the members . I am still trying to get acquainted with all of the current members and get to know a little about them . Some of you , I have met on other groups , others I have met through this group only . Many of you I have found we have many common interests , which is always nice to know .

I have been amazed how many members that I have met that share a real interest in the MF/LF frequencies , with me , chasing NDB's , NAVTEX , part 5 and part 15 stations and beacons . Many also share an interest in QRSS and WSPR as I do . I run a part 15 lowfer beacon running QRSS60 on 185.2984 kHz. , running 24/7 . Any reports or captures would also be appreciated . I love to listen to 1296 moonbounce from Dale's (W4OP) station .

However I have a terrible memory for names and calls , plus we have several people that share the same name . So it sure would be appreciated by this old man with a swiss cheese type memory , if you post you name and call if you have one , or name and location so I can attempt to burn them into my old memory .

This is such a friendly and helpful group for all of its members , I hate to just say hey you , or not knowing your name , call or location , I can't read back through the archives and comment on your post or hopefully offer you an answer or solution to an issues , should you have one . Makes me feel like more of a personal connection . This group is a BIG part of my social life , since I am an old bachelor and pretty much home bound , it also makes me feel like I am talking to one of my friends . This group is a good part of people that I consider my friends these days . I have even chatted with some of you on the phone , which has been great !!

I also enjoy building just about anything electronic , especially if it is radio related .

Hope to get better acquainted with even more of you !!

2361. X1M and digimodes

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-18 07:53:26 UTC
From: Christian Hilgers
Topic: 2361 Message: 2361

Dear all,

as a newbie I hopefully do not start with a FAQ. But I did not find an answer yet.

I found the X1M looks quite interesting from price and technical data, compared with FT-817. I am looking for a portable TRX for use during camping.
I want to to SSB and Digimodes and maybe some CW mainly on the shortwave bands.
I know only FT-817 has 144MHz and 430MHz included.

I hope some of you did or still do digimodes like PSK31 with the X1M and can provide some details on how it works.
Is the QRG stable enough for Digimodes?

Looking forward to answers

Chris = DG7PC

Hi Chris ,

Yes I use it on QRSS often so it is plenty stable enough to handle any digital mode I am aware of . We have several members running digital modes . Paul has an article on a simple cable interface for a SignaLink USB . We have others that have also built their own interfaces .

If you will carefully go through the photo section there are some pictures there of home built interfaces . You didn't say what you planned to do about interfacing for digital modes .

Also in the files sections there is some information on using it on digital modes .

A little browsing in the files and photos section for this group , should give you a lot of information on using it on digital modes .

Also if you can tell us more about how or what you plan to use for a digital interface we have many people that will be more than willing to help you .

As for SSB and CW many of us use it daily for those modes . There is an AGC kit that was designed by a group member , that improves the receiver . You will also see that a matching CW/SSB filter made by Xiegu , especially for the size of the X1M is available as an accessory . You can view it on our USA distributors web page at www.importcommunications.com Ed has a box in the upper left corner of his home page and select Xiegu from it and accessories and you can find the filter and a very nice interface cable for doing firmware updates and rig control with HRD . If you are a serious CW operator the filter is a nice addition .

I am sure Lee , Paul , and some of the other fellows that are more serious digital operators than I am will answer any further questions that you might have later today here .

I used my X1M for digital modes (40 and 20) for a "lighthouse" activation event before it went "belly up" with great success. You just have to remember to "dial back" the drive level to the X1M to keep the power output down to reasonable levels, as the digital mode are effectively "key down." I use a SignaLink USB interface that I had configured for my Alinco DX-SR8 for SSTV. Just used 1/2 of a Ethernet cable, and the stereo plug that came with the radio. Works like a charm. Can't wait to get my replacement X1M back! Anybody heard anything about new shipment from China??

2365. Question re: CW fault in original X1M

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-18 14:50:09 UTC
From: <pal350@...>
Topic: 2365 Message: 2365

It looks like many of the faults in the original X1M have been addressed, but I haven't been able to find any reference to whether the CW glitch has been fixed.

See post #405 for another owner's description of the problem, and my post #406 for a WAV file example. Basically, when sending CW either using the keyer or straight key, the power would drop in a cyclic manner. At the other end, the listener would hear that as dropped characters.

Has the new firmware fixed this?

I no longer have a radio, but might consider getting the new version if the CW works correctly.

GM Joe,

I hope you don't mind me throwing in my 2 cents. Normally you need to run most digital modes at about the same power level as you would the AM carrier if running AM. Typically that is about 25% of your max ,or CW, power output. So that would be about 1.25 Watts out for the X1M.

Many digital modes require ,or work best, with a relatively linear TX output plus many are fairly long duty cycle so the TX components can get hot if you push them too hard.

As for where to control the TX power, the SLUSB TX level control is the place to do that. You can't really dial back the PC mixer control as then the SLUSB may not get enough audio out of the computer to reliably activate its VOX circuit to put your X1M into 'TX'.

Another 2 cents worth... I mostly run WSPR (10,20 and 40 meters) using the X1M but have also done a little PSK-31. I agree that the interface TX level adjustment is the place to modify the TX Wattage. I find that the X1M is remarkably rugged with respect to the output overheating. I have run 2 or more back-to-back WSPR transmitting sessions (2 minutes each) at full 5+ Watts output (measured on my Diamond SX-200 meter) with no issues. I have run the rig on WSPR with a 2 minute transmission every 10 minutes all night, again without any issues. I have sent long PSK-31 transmissions, at full power without any issues. In all cases I had great success being copied by scores of US stations as well as those in Europe, Argentina, Japan, Phillipines and Australia. I assume this means my signal was not distorted despite the extended transmissions at max power. It is my opinion that the X1M can handle high power/high duty cycle use. Of course, each rig is a little different... and there is such a thing as overdriving it. I look at the Wattmeter and turn up the TX drive. The output rises and then plateaus. When I see the plateau, I back of a little and that is my power level.

Dave:
Thanks so much for your comprehensive response! I never thought much about it in the past as the radios were a bit more robust and my data use was very light. I will be using a RigBlaster Pro so I will be able to reduce the TX Level from there. Additionally, I suppose I need to get on with the QRP Amp Project that I've been putting off for so long.

Regards,
- Joe

One more thing I noticed after installing the AGC, not a problem but a "feature"... As others have reported, when you switch the radio on, there is a one second or so delay in the audio appearing. Also, the happy little music the radio played upon startup is gone, as might be expected due to the delayed audio. What I found unexpected is that the display does not light up until the audio starts. It used to light right away, when the "happy beeps" were occurring. I can hear a relay click just as the audio starts and the display lights. So, I guess the X1M somehow monitors the audio circuit to start the display?

Again, no issue, just a surprise to me. I do miss those "happy beeps" though ;-)

Subject: [X1M_QRP-Transceiver] Strange behavior after AGC update

So I have finally got my AGC kit yesterday and found some time today getting all those tiny little parts together. OMG is it tiny! Without magnifying glasses I would have been lost...
Getting the 4.17 volts at the testing point is a little bit difficult because the linear pot is very sensitive. There is a big difference with the AGC and using the radio is now much more comfortable.
One annoying thing appears each time I turn on the radio I have to wait about 10 sec until it has reached its final sound volume. It´s like a tube radio warming up.
Maybe this is related to the fact that I built the kit with the 10 M option for resistor R4.
Is this a regular behavior or did I mess up some of those tiny little parts?
BTW there is a little typo in the part list with 2 times C2.

Andy, DC3AFA

Ok! So I built the mod with the 10m as recommended. I don't think the delay will be a issue for me if it's just a "warm up" scenario. What do you recommend is the optimum setup?

Seems as if my msg didm´t make it through the Yahoo system...

Changed R4 from 10m to 1M (labeling is NOT 1004 but 105!) , had to reduce voltage to 3.09 V. Now there is only a slight delay of about half a second left. Nice!

Thanks again, Dale!!!

You're welcome Andy. For a quick fix you could just add the 1M SMD on top of the 10M.

This would not have happened if we still had color codes!

Hi Andy,
There really isn't anything magic about the 4.17VDC- it sets the AGC threshold and someone might like a higher or slightly lower threshold.

My rig comes up immediately. I did see slow startup on some previous circuits, but not this one. I am also using the 10M timing resistor.
Let's see what others are experiencing. I'll correct the parts list, but I am not seeing the C2 error- can you give me some more detail?

Tnx,
Dale W4OP

Subject: [X1M_QRP-Transceiver] Strange behavior after AGC update

So I have finally got my AGC kit yesterday and found some time today getting all those tiny little parts together. OMG is it tiny! Without magnifying glasses I would have been lost...

Getting the 4.17 volts at the testing point is a little bit difficult because the linear pot is very sensitive. There is a big difference with the AGC and using the radio is now much more comfortable.
One annoying thing appears each time I turn on the radio I have to wait about 10 sec until it has reached its final sound volume. It´s like a tube radio warming up.
Maybe this is related to the fact that I built the kit with the 10 M option for resistor R4.
Is this a regular behavior or did I mess up some of those tiny little parts?
BTW there is a little typo in the part list with 2 times C2.

Andy, DC3AFA

One more thing I noticed after installing the AGC, not a problem but a "feature"... As others have reported, when you switch the radio on, there is a one second or so delay in the audio appearing. Also, the happy little music the radio played upon startup is gone, as might be expected due to the delayed audio. What I found unexpected is that the display does not light up until the audio starts. It used to light right away, when the "happy beeps" were occurring. I can hear a relay click just as the audio starts and the display lights. So, I guess the X1M somehow monitors the audio circuit to start the display?

Again, no issue, just a surprise to me. I do miss those "happy beeps" though ;-)

Also look at your sidetone pot level- could it have inadvertently gotten turned down? The AGC only controls the gain of the MC1350.

You're welcome Andy. For a quick fix you could just add the 1M SMD on top of the 10M.
This would not have happened if we still had color codes!

Hi Andy,
There really isn't anything magic about the 4.17VDC- it sets the AGC threshold and someone might like a higher or slightly lower threshold.

My rig comes up immediately. I did see slow startup on some previous circuits, but not this one. I am also using the 10M timing resistor.
Let's see what others are experiencing. I'll correct the parts list, but I am not seeing the C2 error- can you give me some more detail?

Tnx,
Dale W4OP

Subject: [X1M_QRP-Transceiver] Strange behavior after AGC update

So I have finally got my AGC kit yesterday and found some time today getting all those tiny little parts together. OMG is it tiny! Without magnifying glasses I would have been lost...

Getting the 4.17 volts at the testing point is a little bit difficult because the linear pot is very sensitive. There is a big difference with the AGC and using the radio is now much more comfortable.
One annoying thing appears each time I turn on the radio I have to wait about 10 sec until it has reached its final sound volume. It´s like a tube radio warming up.
Maybe this is related to the fact that I built the kit with the 10 M option for resistor R4.
Is this a regular behavior or did I mess up some of those tiny little parts?
BTW there is a little typo in the part list with 2 times C2.

Andy, DC3AFA

One more thing I noticed after installing the AGC, not a problem but a "feature"... As others have reported, when you switch the radio on, there is a one second or so delay in the audio appearing. Also, the happy little music the radio played upon startup is gone, as might be expected due to the delayed audio. What I found unexpected is that the display does not light up until the audio starts. It used to light right away, when the "happy beeps" were occurring. I can hear a relay click just as the audio starts and the display lights. So, I guess the X1M somehow monitors the audio circuit to start the display?

Again, no issue, just a surprise to me. I do miss those "happy beeps" though ;-)

2376. RE: X1M and digimodes

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-18 18:23:14 UTC
From: <deadgoose@...>
Topic: 2361 Message: 2376

The SignaLink USB interface has THREE knobs on the front:

TX -- sets level of modulation (THIS is what you set back). See this discussion in the <gasp> SignalLink documentation, as well as setting it so that peak levels are maybe 25% of full output (CW). A cheap "CB" SWR meter is especially helpful here, even if you have an automatic tuner.

RX - receive side gain -- set for a good signal in the waterfall.

DLY - "hang time" -- which is important in "keyed" modes like Hellschreiber, where on-off keying is effectively taking place. For PSK-31, Olivia, etc., this is not a concern. For SSTV and Hellschreiber, there may be a slight pause between characters/frames, and you don't want the radio to go into receive.

---In x1m_qrp-transceiver@yahoogroups.com, <k7zt@...> wrote:

Paul:
What control did you use to "dial back" the drive level? Was it the SignalLink, PC Mic Mixer, or the XM1? I'm looking to use my XM1 on the digital modes. Can you suggest some rule of thumb techniques for setting this level so I won't fry mine?

Thanks,
DE K7ZT - Joe

Subject: [X1M_QRP-Transceiver] Re: X1M and digimodes

I used my X1M for digital modes (40 and 20) for a "lighthouse"
activation event before it went "belly up" with great success. You just
have to remember to "dial back" the drive level to the X1M to keep the
power output down to reasonable levels, as the digital mode are
effectively "key down." I use a SignaLink USB interface that I had
configured for my Alinco DX-SR8 for SSTV. Just used 1/2 of a Ethernet
cable, and the stereo plug that came with the radio. Works like a charm.
Can't wait to get my replacement X1M back! Anybody heard anything about
new shipment from China??

Hi Gary,
In my Photos file (w4op) check out the third photo- it shows exactly where to place the short in order to be able to get full volume to an external speaker.
http://groups.yahoo.com/neo/groups/X1M_QRP-Transceiver/photos/albums/38547135/lightbox/295624804
Still works fine with headphones.
Note this is NOT the mod for increasing the gain of the LM380 by 12dB which is necessary for the AGC mod.

2380. Re: UK Calling - User Guide ☐ AGC Kit Question and Widgets!

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-18 19:44:13 UTC
From: m5zzr@btinternet.com
Topic: 2236 Message: 2380

Thanks Mark, Dale, Stephen and Mike for the RF source suggestions ☐ plenty for me to go on there. What a helpful group. Apologies for the delayed reply but work has got in the way.

I've had my X1M Pro for about 2 weeks now. I'm still surprised every time I turn it on; how super is this little radio?

If there are no stations present, it's silent. The noise floor is rock bottom but in the presence of even quite weak stations it seems to burst into life. So far I've only transmitted on 80 and 40 meters. I've tried on 10 but we have little in the way of inter-G on 10 and 5 watts with a vertical isn't quite a DX setup, but I'll get there.

Apparently I was lucky to obtain one of the first few radios to hit our shores! The UK supplier that I purchased from quickly sold out. I have no performance issues with my radio. It does everything it could be expected to do and more. There were a few loose bits but this was all quickly resolved.

Incidentally, the F buttons especially F3 were pretty unreliable. In the event I removed the front panel to investigate; there is a small board behind the front panel that acts as a guide for the buttons, but in my radio it was floating and this appeared to be the problem. My solution was to stick four tiny pads of foam rubber on the front of the board only about 1mm thick. These are compressed by the re-fitting of the front panel, thereby curtailing any further movement. The result is that all the buttons now have a nice, positive feel.

In the process I replaced the control knobs with the most appealing that I had to hand; slightly larger on the encoder does feel more satisfying. Mine are the grub screw variety of knob rather than the push fit type originally fitted. I inserted a sliver of 1mm aluminium sheet in the slotted shafts to prevent the shafts from compressing under the action of the grub screw. I also re- coloured LK/SYS button as I had a tendency to hit this one instead of F5 by mistake.

I differ from others in my response to the audio output from the radio. Maybe mine is an exception to the rule but I have lots of audio from my speaker ☐ so much so that I can increase it to distortion. Maybe this will cease to be the case when the AGC mod is done, but for now it requires no modification. My kit is on order from Dale.

Although my radio doesn't appear to actually need any extra audio I still prefer to listen through a little amplified re-chargeable `X-mini' IPhone speaker ☐ I use the volume on the radio as

if it were RF gain and the volume on the speaker as AF gain.

By the way, upon pressing and holding F5, I note that I have version V1.01b USA ☐ Oct 14 2013 firmware so I guess that this batch of UK radios came via the USA? Does this ring any bells with you Ed? My S/N# is 1066.

I've made a few adjustments to the supplied microphone and also made up a PTT widget for a PC type microphone. Both seem to work equally well and receive good audio reports.

I'm not sure if I understand the modus operandi of the microphone circuit (I'm just a hobbyist) but it appears to me that PTT switches about 5v from the ring to sleeve activating the Tx relay and also a switching-in a bias of about 5v to the tip. I'm guessing (without foundation) that the LED might be a voltage divider, although I don't know why one should be necessary?

If anyone could clarify what's going on here I would really like to understand it better.

I've made a stand for my radio; it's not as grand as others on here but it does the job. It's a simple folded and riveted aluminium sheet and the radio attaches to it with HD Velcro.

Using this method I should be able to easily and securely switch between mounts that I have yet to make ☐ dashboard, handlebar, hmmm - armband etc. or maybe also use it to attach an ATU, a meter or a battery pack.

I've posted some pictures of my menial widget offerings to date.

Thanks, Charlie. From reading posts here after not doing so since summer, it looks like cables and firmware updates are available to bring the older sets up to date, or at

least more up to date. Is that right?

Thanks,

Mark

It looks like many of the faults in the original X1M have been addressed, but I haven't been able to find any reference to whether the CW glitch has been fixed.

See post #405 for another owner's description of the problem, and my post #406 for a WAV file example. Basically, when sending CW either using the keyer or straight key, the power would drop in a cyclic manner. At the other end, the listener would hear that as dropped characters.

Has the new firmware fixed this?

I no longer have a radio, but might consider getting the new version if the CW works correctly.

Hi Mark ,

Yes , we are still waiting on the final firmware upgrade , or at least to the best of our knowledge the final upgrade . It is a MUCH different radio now than even the early Pro models with the current level of firmware updates . Many changes have been made since early summer , all for the better . A very nice little radio now and sure to be in high demand with these final changes in the firmware , that we expect just any day now .

They also did not abandon the original version of the X1M with the round buttons either . A new faceplate complete with new display is now available for order and it makes it a true Pro . I have been using this faceplate on an original X1M for about 2 months now and unless you are familiar with the looks of all of the internal boards on the X1M series once installed , you will never know that it wasn't a true production line Pro .

Subject: Re: [X1M_QRP-Transceiver] speaker mod

□

Hi Gary,

In my Photos file (w4op) check out the third photo- it shows exactly where to place the short in order to be able to get full volume to an external speaker.

http://groups.yahoo.com/neo/groups/X1M_QRP-Transceiver/photos/albums/38547135/lightbox/295624804

Still works fine with headphones.

Note this is NOT the mod for increasing the gain of the LM380 by 12dB which is necessary for the AGC mod.

Dale W4OP

Joe , there is a pin out diagram in the files or photos section for this group for the mike plug . There is no "standard" for the color code for the stock mike . They appear to have used more than one supplier and I have seen different colors for different microphones .

2389. HELP WANTED (VOLUNTEER BUILDERS)

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-19 01:04:54 UTC
From: Charlie , W5COV
Topic: 2389 Message: 2389

Okay I know many of you are very likely tired of my posts , which I do indeed tend to ramble on and write long e-mails on a variety of subjects and topics .
So if you are one of those people I do apologize and please just delete the post .
One day when we get thousands of these rigs in the hands of extremely satisfied users and there are plenty of people that are plenty familiar with this radio , I'll move on to another project , but never give up this radio or this group. I have made too many very good friends on this group.
Just met another one today , after my post last night to learn more about the current group members . Ended up he and I lived in neighboring small towns at one time and I do genealogy as a hobby and found out that some of my family were his next door neighbors , plus a few other things . THANKS to EVERYONE that is sharing their name , location , call !! You will be amazed at just how small this world is and how it makes this group function so much better when we all know a little more about each other .

There is indeed going to be another run of the AGC kits , for those who might have missed out on the first run and for all of the new users that will be joining us as soon as this production run gets to the Distributors and Dealers and on down to the end users . I expect a HUGE influx of new members , hopefully just in time for Christmas . I do not know the exact size of this production run , but I am quite certain it will likely be the largest run yet and also likely will sell out more quickly than any of the previous runs. The next runs after this one I anticipate will just get larger and larger as more people see just how good of a radio , already assembled , that they are getting , and I don't even need to say "FOR THE PRICE" either . This radio has come to a point with this run , that it can stand up against any other kits and assembled radios COMPLETELY ON ITS OWN MERITS !!!!

What we ARE in need of is ANYONE that has the time , ability , and inclination to help several of their fellow hams . Hopefully , well not really hopefully , but I know that myself and some others have plans to offer some more accessories for the X1M . Right now the only kit that I am aware of , that is a nice addition to the radio , is the AGC kit designed by Dale , W4OP . This particular run of boards and parts , I will be handling the "kitting portion" once all pieces are ordered and received . Again this is a not for profit kit , so to let Dale be able to spend his time keeping up with his own company business and who knows , maybe even give him time to develop some other accessory for the X1M :) I have agreed to kit them up and ship them out . More information when more is available as to when they will once again be available .

There are some members that would like to have this accessory and a couple have contacted me and told me they have the ability to install a completed unit , but just can't manage the actual assembly of the board . I personally can certainly relate to this , or I would be a volunteer to assemble them . There is no possible way with my health issues , eyesight and hand tremors , that I can count on being able to regularly assemble these. So if you are someone that would be willing to do one or more boards for those that can't , PLEASE post to the group if you are wiling to help these people . The two of you can get together one on one and work out the details .

Like I mentioned I do KNOW that some other accessories are in the design / prototype stage . However some of these will be fully assembled and the ones that will likely be kits , that I have seen , "should" be able to be assembled by the "average" builder . On kits that size , I would be a volunteer to assemble those if for some reason the person wanting it was unable to do so .

Along that same line , if you have an accessory that you are working on I would appreciate your contacting me off list . I have a notebook here of possible accessories and don't want to reinvent the wheel , especially if someone else is further along than I am . Also if you have any suggestions as to what you might want to see as an accessory , but for some reason can't or don't want to build it , please let me know about that also . I am not out looking to steal anyone elses work and would love to have a group of us that build and tinker where we can exchange some ideas and perhaps help each other . I plan a later post , to look for some help on some areas that I am weak in and be able to collaborate with other builders . Maybe we can form a kind of informal e-mail group for people like us to meet and exchange ideas and help each other . Maybe the X1M tinkerers group , or something similar , so as to not tie up this group and let it remain a place where people can get help and enjoy using and operating the rig . At least one of my "projects" is going to use a matching extrusion to the X1M . My home e-mail address , if you are interested in discussing mods and accessories is cvest AT cox.net .

Thanks for your patience ,

Charlie , W5COV

Hello,
I have assembled the AGC board and found it quite easy to build. I have previously built numerous SMD kits and homebrew projects. Having said that I need to stress that I have NOT yet purchased the radio. I figured I would get the AGC kit while they lasted. I plan to buy the radio soon.
I am 67 yrs old but thankfully have no problems building these small boards and would gladly assemble them at no charge for those that can't do it themselves. Of course the kit owner would have to pay all shipping costs.
I am N2LZV and my name and address are accurate in the QRZ website.
Last comment is, these little boards are quite easy to put together. If one can tackle it themselves it is good experience. If self assembly is not possible, I will be happy to help.
Ken

2393. AGC Installation - AF Mod Question

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-19 01:22:21 UTC
From: rickmac06@frontier.com
Topic: 2393 Message: 2393

I have hit a snag while installing the AGC kit. According to the manual:

"YOU MUST DO MY AF GAIN MOD,
WHICH CONSISTS OF SHORTING OUT RESISTOR R80C ON THE BOTTOM SIDE OF THE
TOP BOARD ☐ DIRECTLY UNDERNEATH U8C, THE LM386 IC."

I'm unclear on how to accomplish this. I have board version 3.01b.
I have located the LM386 IC. Directly under it is a SMD resistor that is located on the trace pin 1 of IC386, and it's value is 102. Do I remove that resistor and jump across it? Is that what short resistor R80C is revering to? Thanks guys, Regards, John KC9YAW.

2394. Re: XM1 Microphone wire color codes and pin-outs

The microphone pin out is in the "User's Guide" in the files section.

As soon as I get my replacement X1M, I'll update the manual.

There's a pic in the picture section. I forget whose album. I may be mistaken and it's in the files. Possibly under mods. It's two pics.

Hi John I did not even remove the resistor just put a wire across from pin 1 of the LM-386 to the capacitor . Yes you are just shorting the resistor out so you have zero ohms in place of the resistor. If one was good and had the parts on hand you could replace it with a zero ohm jumper .

There are some pictures in the photo section . If you need more detailed help , please let us know . Sorry was busy answering some e-mails so I was a little behind on reading posts . GREAT to see the activity picking up.

From: rickmac06@frontier.com
Topic: 2393 Message: 2398

Thanks for the reply, but I have already been to the two pictures that you are referring to. They are in the mod section in a zip file called "X1M-PRO Increased RX Gain Modification" My board does not look like the board in the photo. That is why I included the version number of my board. In the photo there is the a jumper on what appears to be pin 1 of the IC, then there is a large can in the middle follow by a smaller can on the right (where the other side of the jumper makes contact.) My board does not have the large can in the middle. So my board is different than the one in the photo. When referring to the photo I am confused as to how that jumper is shorting resistor R80C. Please forgive my lack of understanding. Perhaps someone can clarify.
I'm concerned that the layout of my board does not match the one in the photo. Thanks, John.

Hi Charlie,
Thanks for the explanation. Thanks for helping me understand what we are trying to do with the jumper. Now that I follow the trace I can see how it bypasses the resistor and I can see that the small can is the cap that I need to jump to. I was just very concerned at first because of the board in the photo has a large can next to the capacitor and mine does not. Think that I'm good to go now. Thanks again, John.

alternatively, instead of removing the resistor and replacing it with a zero ohms one, just solder the zero ohm critter over the resistor. Less risk of damaging the board if you dont have to apply heat to remove components.

No problem John , always glad to help if I can . Yes there are two different boards and I didn't look at an actual board to see which one you had . Just enough difference in the two to be confusing , although I think that you have the board of the two that I found easier to modify . I don't take many pictures and perhaps once this new shipment comes in and gets all sold out , we can take time to go back and organize our information , from beginning to the latest model . We have kind of just updated the page on the fly .
Any problems let us know .

John,
Most of us are learning from the few. I don't have my radio yet as I am waiting for the new batch to get in. Ordered and anxiously waiting. I apologize. I didn't know there was a difference. Can you post pics of what you have done when you are finished. It may be a mute point with the new version. But, can't hurt to have a reference if its the same.

Mike , purely a guess on my part . The audio mod will likely be done at the factory . The AGC mod I would say not a chance , since it would require a board and hardware change .

As Charlie said, the factory may install a zero Ohm resistor in the LM380 circuit as that is only a part change.
I have no current plans to look at a new radio.
My real amateur radio interest is 1296MHz moonbounce and I have to get my 600W solid state amp mounted at the dish before the 2nd leg of the ARRL EME contest- so my little spare time is gone.

2411. X1M will not power up after AGC Mod

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-19 04:03:25 UTC
From: rickmac06@frontier.com
Topic: 2411 Message: 2411

Well I wish that I had better news. Just finished installing the AGC board and now the radio will not power up. I do see a load on the poweer supply when I flip the switch. Measuring across pin 5 of MC1350 I only get MvoltsDC and the pot R1 on the board has no affect of raising it into the volts. Any ideas before I take the mod out and try to get radio back to pre agc install config?

Thanks, John.

John do you happen to have a way to take a couple of pictures of the
install ?

Do you have 9VDC on the AGC board?

Dale W4OP

Well I wish that I had better news. Just finished installing the AGC board and now the radio will not power up. I do see a load on the poweer supply when I flip the switch. Measuring across pin 5 of MC1350 I only get MvoltsDC and the pot R1 on the board has no affect of raising it into the volts. Any ideas before I take the mod out and try to get radio back to pre agc install config?

Thanks, John.

I suspect that somehow you have shorted the 9VDC line to ground or near ground.
Pad W1 is the 9VDC pad
Pad W2 is the GND Pad.

Disconnect the 9V from the AGC board and see if all is well.
Can you take hi res pix of the board and then a general view of your installation showing the wiring?

One more quick question , did you test the audio mod before installing
the AGC board ?

2416. AGC Mod but I have no audio output

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-19 05:04:41 UTC
From: rickmac06@frontier.com
Topic: 2416 Message: 2416

The AGC Board is installed. The radio powers up and I get the customary beep. After power up no audio output at all out the speaker. I even plugged in an external speaker, but no joy. I do have 4.7VDC on pin5 of MC1350. The mute button is not on. Any ideas? Thanks, John.

4.7VDC is too high a voltage on pin 5. Turn it back to about 4.17 or even lower as in the manual.

I had the same problem. As it turned out, the front panel (with the lighted display and the buttons) had worked loose a little during the install. It seems like a mm or two made all the difference. I pushed on the display board (front) toward the back of the radio and all was well. Whew!!!

I hope this message was clear.

Greetings guys and thank all of you for your help. Got it all working at about 2am this morning. For those that are curious here is what I did wrong that caused my problems.

(1) The lack of power - I resolved this one quickly and tried to delete my post from the list before anybody saw it. You guys are quick. I had taken the top board out to get a better look at doing the (gain mod) under the board. When I put the board back in the alignment of the rear connector pins was not good. All pins were out of sequence. I'm dang lucky that I did not blow my radio. I cannot believe how brain dead I was on that one.

2) Lack of audio - Dale you caught my mistake. I had set the voltage to high at 4.7vdc instead of 4.17 as the manual clearly calls for. Once again brain dead because I was reading from the manual when I made the adjustment. After setting the voltage correctly the audio came alive.

I've only spent a few minutes testing the AGC this morning but it seems to be working very well. Certainly worth the effort.

The kit was not not difficult to put together. The directions were very good with the exception of needing a bit more explanation with regard to the (gain mod). The posted picture of the mod did not help me at first because my board is laid out a bit different than the one in the photo. I was unclear what was needed from the description from the manual "shorting out resistor R80C" In all fairness any seasoned kit builder or electronics guy would not have had a problem figuring it out. Thanks goes out to Charlie W5COV for helping me sort this one out.

For the less experienced builder I would offer this advice.

1)Work very slowly. Check and double check your steps. There is NO need to remove any boards. That includes the gain mod. The jump points are on the edge of the underside of the top board. The idea here is to put one end of your jumper on pin1 of LM386 IC (bypassing the resistor next to pin1) over to the small capacitor as shown in the photo in the mod section called "X1M-PRO Increased RX Gain Modification - Pictures" You can follow the trace from pin1 to the resistor to the capacitor. Refer to the photo to see which side of the cap to connect to.

2)Do not work on the installation when you are tired. It can wait
until you are fresh and have all brain cells on board.

3)If you encounter a problem do not panic. The guys here on the user
group are friendly and very helpful. Don't be afraid to ask for help.

This was a fun project. The AGC is working great. It is well within reach of anyone that can solder and follow directions. The problems that I had were a reflection of a lack of attention to reassembly of the radio (which was not needed for the mod)and not double checking my voltage as prescribed in the installation manual.

I would like to thank Charlie, Onionman, and Dale for helping me sort out my oversight. Kind regards and thanks so much! You guys are great.

John KC9YAW

Made my day. I have been thinking about your install all morning.
BTW, for others that are interested- the MC1350 appears to run at full gain with somewhere around 4.1VDC on Pin 5. The manufacturer set this voltage with the on board pot. It only takes about 250mV change to reduce the gain from wide open to about -60dB or so. Pin 5 is actualy current controlled despite what the mfg graph shows. So, if one sets pin 5 at 4.7VDC, the system gain is drastically reduced.
It would require an extremely strong signal to be heard at all.

One might think that instead of doing the AF gain mod, I'll just run the preamp full time. The issue here is that when a radio has the preamp turned on, important specs, like IP3 get reduced by the gain figure of the preamp. Here at my QTH, if I engage the preamp on 160M, I hear intermod/crossmod all across the band. By doing the AF Gain mod, you increase system gain with no impact upon front end spec characteristics.

If the member who posted the photo of the AF Gain mod will give me his permission, I'll add that photo and some text to the AGC manual.

There is only one resistance check that is meaningful on the completed AGC board (before installation) and that is from pad W1 to pad W2. Put your red probe on W1 and black probe on W2. Charlie measured 10.4K resistance- just a crude check that at least the +9VDC line is not shorted. I'll add this to the manual also.

73,

Dale W4OP

Hi Mike,
If you are referring to the W1 to W2 test, you are testing the resistance between the pads. Because semiconductors are involved, it is important that the (+) lead of the ohm meter be on pad W1. I do not have an uninstalled board here to test, so I cannot confirm that polarity makes a difference- maybe someone can do that test. Until then, just observe the red probe on pad W1.

(1) The lack of power - I resolved this one quickly and tried to delete my post from the list before anybody saw it. You guys are quick. I had taken the top board out to get a better look at doing the (gain mod) under the board. When I put the board back in the alignment of the rear connector pins was not good. All pins were out of sequence. I'm dang lucky that I did not blow my radio. I cannot believe how brain dead I was on that one.

2) Lack of audio - Dale you caught my mistake. I had set the voltage to high at 4.7vdc instead of 4.17 as the manual clearly calls for. Once again brain dead because I was reading from the manual when I made the adjustment. After setting the voltage correctly the audio came alive.

I've only spent a few minutes testing the AGC this morning but it seems to be working very well. Certainly worth the effort.

The kit was not not difficult to put together. The directions were very good with the exception of needing a bit more explanation with regard to the (gain mod). The posted picture of the mod did not help me at first because my board is laid out a bit different than the one in the photo. I was unclear what was needed from the description from the manual "shorting out resistor R80C" In all fairness any seasoned kit builder or electronics guy would not have had a problem figuring it out. Thanks goes out to Charlie W5COV for helping me sort this one out.

For the less experienced builder I would offer this advice.

1)Work very slowly. Check and double check your steps. There is NO need to remove any boards. That includes the gain mod. The jump points are on the edge of the underside of the top board. The idea here is to put one end of your jumper on pin1 of LM386 IC (bypassing the resistor next to pin1) over to the small capacitor as shown in the photo in the mod section called "X1M-PRO Increased RX Gain Modification - Pictures" You can follow the trace from pin1 to the resistor to the capacitor. Refer to the photo to see which side of the cap to connect to.

2)Do not work on the installation when you are tired. It can wait
until you are fresh and have all brain cells on board.

3)If you encounter a problem do not panic. The guys here on the user
group are friendly and very helpful. Don't be afraid to ask for help.

This was a fun project. The AGC is working great. It is well within reach of anyone that can solder and follow directions. The problems that I had were a reflection of a lack of attention to reassembly of the radio (which was not needed for the mod)and not double checking my voltage as prescribed in the installation manual.

I would like to thank Charlie, Onionman, and Dale for helping me sort out my oversight. Kind regards and thanks so much! You guys are great.

Hi Mike,
If you are referring to the W1 to W2 test, you are testing the resistance between the pads. Because semiconductors are involved, it is important that the (+) lead of the ohm meter be on pad W1. I do not have an uninstalled board here to test, so I cannot confirm that polarity makes a difference- maybe someone can do that test. Until then, just observe the red probe on pad W1.

Subject: [X1M_QRP-Transceiver] Success !!! All is well.

Greetings guys and thank all of you for your help. Got it all working at about 2am this morning. For those that are curious here is what I did wrong that caused my problems.

(1) The lack of power - I resolved this one quickly and tried to delete my post from the list before anybody saw it. You guys are quick. I had taken the top board out to get a better look at doing the (gain mod) under the board. When I put the board back in the alignment of the rear connector pins was not good. All pins were out of sequence. I'm dang lucky that I did not blow my radio. I cannot believe how brain dead I was on that one.

2) Lack of audio - Dale you caught my mistake. I had set the voltage to high at 4.7vdc instead of 4.17 as the manual clearly calls for. Once again brain dead because I was reading from the manual when I made the adjustment. After setting the voltage correctly the audio came alive.

I've only spent a few minutes testing the AGC this morning but it seems to be working very well. Certainly worth the effort.

The kit was not not difficult to put together. The directions were very good with the exception of needing a bit more explanation with regard to the (gain mod). The posted picture of the mod did not help me at first because my board is laid out a bit different than the one in the photo. I was unclear what was needed from the description from the manual "shorting out resistor R80C" In all fairness any seasoned kit builder or electronics guy would not have had a problem figuring it out. Thanks goes out to Charlie W5COV for helping me sort this one out.

For the less experienced builder I would offer this advice.

1)Work very slowly. Check and double check your steps. There is NO need to remove any boards. That includes the gain mod. The jump points are on the edge of the underside of the top board. The idea here is to put one end of your jumper on pin1 of LM386 IC (bypassing the resistor next to pin1) over to the small capacitor as shown in the photo in the mod section called "X1M-PRO Increased RX Gain Modification - Pictures" You can follow the trace from pin1 to the resistor to the capacitor. Refer to the photo to see which side of the cap to connect to.

2)Do not work on the installation when you are tired. It can wait
until you are fresh and have all brain cells on board.

3)If you encounter a problem do not panic. The guys here on the user

From: Charlie , W5COV
Topic: 2416 Message: 2426

Polarity doesn't make a difference so just looking to see no shorts or high current path for any reason. Looks like something in the neighborhood of 10 K would be a good approximate number .

Hi Mike,
If you are referring to the W1 to W2 test, you are testing the resistance between the pads. Because semiconductors are involved, it is important that the (+) lead of the ohm meter be on pad W1. I do not have an uninstalled board here to test, so I cannot confirm that polarity makes a difference- maybe someone can do that test. Until then, just observe the red probe on pad W1.

Made my day. I have been thinking about your install all morning.
BTW, for others that are interested- the MC1350 appears to run at full gain with somewhere around 4.1VDC on Pin 5. The manufacturer set this voltage with the on board pot. It only takes about 250mV change to reduce the gain from wide open to about -60dB or so. Pin 5 is actualy current controlled despite what the mfg graph shows. So, if one sets pin 5 at 4.7VDC, the system gain is drastically reduced.
It would require an extremely strong signal to be heard at all.

One might think that instead of doing the AF gain mod, I'll just run the preamp full time. The issue here is that when a radio has the preamp turned on, important specs, like IP3 get reduced by the gain figure of the preamp. Here at my QTH, if I engage the preamp on 160M, I hear intermod/crossmod all across the band. By doing the AF Gain mod, you increase system gain with no impact upon front end spec characteristics.

If the member who posted the photo of the AF Gain mod will give me his permission, I'll add that photo and some text to the AGC manual.

There is only one resistance check that is meaningful on the completed AGC board (before installation) and that is from pad W1 to pad W2. Put your red probe on W1 and black probe on W2. Charlie measured 10.4K resistance- just a crude check that at least the +9VDC line is not shorted. I'll add this to the manual also.

73,

Dale W4OP

Subject: [X1M_QRP-Transceiver] Success !!! All is well.

Greetings guys and thank all of you for your help. Got it all working at about 2am this morning. For those that are curious here is what I did wrong that caused my problems.

(1) The lack of power - I resolved this one quickly and tried to delete my post from the list before anybody saw it. You guys are quick. I had taken the top board out to get a better look at doing the (gain mod) under the board. When I put the board back in the alignment of the rear connector pins was not good. All pins were out of sequence. I'm dang lucky that I did not blow my radio. I cannot believe how brain dead I was on that one.

2) Lack of audio - Dale you caught my mistake. I had set the voltage to high at 4.7vdc instead of 4.17 as the manual clearly calls for. Once again brain dead because I was reading from the manual when I made the adjustment. After setting the voltage correctly the audio came alive.

I've only spent a few minutes testing the AGC this morning but it seems to be working very well. Certainly worth the effort.

The kit was not not difficult to put together. The directions were very good with the exception of needing a bit more explanation with regard to the (gain mod). The posted picture of the mod did not help me at first because my board is laid out a bit different than the one in the photo. I was unclear what was needed from the description from the manual "shorting out resistor R80C" In all fairness any seasoned kit builder or electronics guy would not have had a problem figuring it out. Thanks goes out to Charlie W5COV for helping me sort this one out.

For the less experienced builder I would offer this advice.

1)Work very slowly. Check and double check your steps. There is NO need to remove any boards. That includes the gain mod. The jump points are on the edge of the underside of the top board. The idea here is to put one end of your jumper on pin1 of LM386 IC (bypassing the resistor next to pin1) over to the small capacitor as shown in the photo in the mod section called "X1M-PRO Increased RX Gain Modification - Pictures" You can follow the trace from pin1 to the resistor to the capacitor. Refer to the photo to see which side of the cap to connect to.

2)Do not work on the installation when you are tired. It can wait
until you are fresh and have all brain cells on board.

3)If you encounter a problem do not panic. The guys here on the user
group are friendly and very helpful. Don't be afraid to ask for help.

This was a fun project. The AGC is working great. It is well within reach of anyone that can solder and follow directions. The problems that I had were a reflection of a lack of attention to reassembly of the radio (which was not needed for the mod)and not double checking my voltage as prescribed in the installation manual.

I would like to thank Charlie, Onionman, and Dale for helping me sort out my oversight. Kind regards and thanks so much! You guys are great.

GREAT NEWS John !!! This is one of the best groups around period !!
Hams helping hams get maximum enjoyment out of this radio and I think we
all learn something along the way .

Everyone brings some different experience to the table , so when all of
that knowledge is combined and shared , the group can handle pretty much
any issues .

Seems as if I meet a new friend on here every day . More of a family
atmosphere and we try hard to keep it a friendly one too . I like it
when I feel at ease addressing someone by name and if I hear them on the
air I will likely recognize their call too and try to work them .

2430. BUILDERS LIST

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-19 17:09:05 UTC
From: Charlie , W5COV
Topic: 2430 Message: 2430

In the wee hours of the morning , I added a list of people that have volunteered to help others put the SMD AGC kit together .
Always room for more . If you want to add your name , please feel free to add it to the list .
It is on the group home page , under the Files section .

Charlie , W5COV

I tried to do a new topic "Sked" but it won't go through on my iPhone.
I'm in SW CT. Anybody around to get on the air?

Today I try to work on 17 meter at 18130 but no luck. but went to 20 meter 14.180 work ve3 and got a 58/9 with the rig and an endfed wire. first time with an end fed antenna.
580 mile between us and he was strong 59+. so I was happy with it. em88 to fn26jf

try again tomorrow hope to work a few more dx or state anyone to come back haha

BTW, for others that are interested- the MC1350 appears to run at full gain with somewhere around 4.1VDC on Pin 5. The manufacturer set this voltage with the on board pot. It only takes about 250mV change to reduce the gain from wide open to about -60dB or so. Pin 5 is actualy current controlled despite what the mfg graph shows. So, if one sets pin 5 at 4.7VDC, the system gain is drastically reduced.
It would require an extremely strong signal to be heard at all.

One might think that instead of doing the AF gain mod, I'll just run the preamp full time. The issue here is that when a radio has the preamp turned on, important specs, like IP3 get reduced by the gain figure of the preamp. Here at my QTH, if I engage the preamp on 160M, I hear intermod/crossmod all across the band. By doing the AF Gain mod, you increase system gain with no impact upon front end spec characteristics.

If the member who posted the photo of the AF Gain mod will give me his permission, I'll add that photo and some text to the AGC manual.

There is only one resistance check that is meaningful on the completed AGC board (before installation) and that is from pad W1 to pad W2. Put your red probe on W1 and black probe on W2. Charlie measured 10.4K resistance- just a crude check that at least the +9VDC line is not shorted. I'll add this to the manual also.

73,

Dale W4OP

Subject: [X1M_QRP-Transceiver] Success !!! All is well.

Greetings guys and thank all of you for your help. Got it all working at about 2am this morning. For those that are curious here is what I did wrong that caused my problems.

(1) The lack of power - I resolved this one quickly and tried to delete my post from the list before anybody saw it. You guys are quick. I had taken the top board out to get a better look at doing the (gain mod) under the board. When I put the board back in the alignment of the rear connector pins was not good. All pins were out of sequence. I'm dang lucky that I did not blow my radio. I cannot believe how brain dead I was on that one.

2) Lack of audio - Dale you caught my mistake. I had set the voltage to high at 4.7vdc instead of 4.17 as the manual clearly calls for. Once again brain dead because I was reading from the manual when I made the adjustment. After setting the voltage correctly the audio came alive.

I've only spent a few minutes testing the AGC this morning but it seems to be working very well. Certainly worth the effort.

The kit was not not difficult to put together. The directions were very good with the exception of needing a bit more explanation with regard to the (gain mod). The posted picture of the mod did not help me at first because my board is laid out a bit different than the one in the photo. I was unclear what was needed from the description from the manual "shorting out resistor R80C" In all fairness any seasoned kit builder or electronics guy would not have had a problem figuring it out. Thanks goes out to Charlie W5COV for helping me sort this one out.

For the less experienced builder I would offer this advice.

1)Work very slowly. Check and double check your steps. There is NO need to remove any boards. That includes the gain mod. The jump points are on the edge of the underside of the top board. The idea here is to put one end of your jumper on pin1 of LM386 IC (bypassing the resistor next to pin1) over to the small capacitor as shown in the photo in the mod section called "X1M-PRO Increased RX Gain Modification - Pictures" You can follow the trace from pin1 to the resistor to the capacitor. Refer to the photo to see which side of the cap to connect to.

2)Do not work on the installation when you are tired. It can wait
until you are fresh and have all brain cells on board.

3)If you encounter a problem do not panic. The guys here on the user
group are friendly and very helpful. Don't be afraid to ask for help.

This was a fun project. The AGC is working great. It is well within reach of anyone that can solder and follow directions. The problems that I had were a reflection of a lack of attention to reassembly of the radio (which was not needed for the mod)and not double checking my voltage as prescribed in the installation manual.

I would like to thank Charlie, Onionman, and Dale for helping me sort out my oversight. Kind regards and thanks so much! You guys are great.

It would require an extremely strong signal to be heard at all.

One might think that instead of doing the AF gain mod, I'll just run the preamp full time. The issue here is that when a radio has the preamp turned on, important specs, like IP3 get reduced by the gain figure of the preamp. Here at my QTH, if I engage the preamp on 160M, I hear intermod/crossmod all across the band. By doing the AF Gain mod, you increase system gain with no impact upon front end spec characteristics.

If the member who posted the photo of the AF Gain mod will give me his permission, I'll add that photo and some text to the AGC manual.

There is only one resistance check that is meaningful on the completed AGC board (before installation) and that is from pad W1 to pad W2. Put your red probe on W1 and black probe on W2. Charlie measured 10.4K resistance- just a crude check that at least the +9VDC line is not shorted. I'll add this to the manual also.

73,

Dale W4OP

Subject: [X1M_QRP-Transceiver] Success !!! All is well.

Greetings guys and thank all of you for your help. Got it all working at about 2am this morning. For those that are curious here is what I did wrong that caused my problems.

(1) The lack of power - I resolved this one quickly and tried to delete my post from the list before anybody saw it. You guys are quick. I had taken the top board out to get a better look at doing the (gain mod) under the board. When I put the board back in the alignment of the rear connector pins was not good. All pins were out of sequence. I'm dang lucky that I did not blow my radio. I cannot believe how brain dead I was on that one.

2) Lack of audio - Dale you caught my mistake. I had set the voltage to high at 4.7vdc instead of 4.17 as the manual clearly calls for. Once again brain dead because I was reading from the manual when I made the adjustment. After setting the voltage correctly the audio came alive.

I've only spent a few minutes testing the AGC this morning but it seems to be working very well. Certainly worth the effort.

The kit was not not difficult to put together. The directions were very good with the exception of needing a bit more explanation with regard to the (gain mod). The posted picture of the mod did not help me at first because my board is laid out a bit different than the one in the photo. I was unclear what was needed from the description from the manual "shorting out resistor R80C" In all fairness any seasoned kit builder or electronics guy would not have had a problem figuring it out. Thanks goes out to Charlie W5COV for helping me sort this one out.

For the less experienced builder I would offer this advice.

1)Work very slowly. Check and double check your steps. There is NO need to remove any boards. That includes the gain mod. The jump points are on the edge of the underside of the top board. The idea here is to put one end of your jumper on pin1 of LM386 IC (bypassing the resistor next to pin1) over to the small capacitor as shown in the photo in the mod section called "X1M-PRO Increased RX Gain Modification - Pictures" You can follow the trace from pin1 to the resistor to the capacitor. Refer to the photo to see which side of the cap to connect to.

2)Do not work on the installation when you are tired. It can wait
until you are fresh and have all brain cells on board.

3)If you encounter a problem do not panic. The guys here on the user
group are friendly and very helpful. Don't be afraid to ask for help.

This was a fun project. The AGC is working great. It is well within reach of anyone that can solder and follow directions. The problems that I had were a reflection of a lack of attention to reassembly of the radio (which was not needed for the mod)and not double checking my voltage as prescribed in the installation manual.

I would like to thank Charlie, Onionman, and Dale for helping me sort out my oversight. Kind regards and thanks so much! You guys are great.

John KC9YAW

Congratulations Gary !! We all work DX regularly , even with the rotten band conditions . I just get on and act like I am a big gun station , the guys on the other end have no idea what I am using . Very few times that I have not ended up working any station that I was trying to work . Usually if it is late or the station isn't a really rare one and there is a huge pileup anyway , I usually just move on to the next station instead of trying to battle it out .
I reset all of my logbook numbers to zero shortly before I bought the X1M the first part of the summer and I already have a stack of QSL's here from all over the world and many more contacts logged through LOTW and EQSL.org .
Was it a homebrew end fed wire and a 1/4 or half wave ?
One of the major decisions that I had made before I started looking for a new QRP rig , which I figured in my price range would likely be a kit and likely not even have SSB , was that it HAD to be a full 5 watt radio . I didn't want another junk kit that was 1 or 2 watts . I know we are only talking about approximately 3 dB , but when you are already that low in power it really does make a difference . I feel sorry for so many new hams that buy those 1 or 2 watt kits and they usually don't have good antenna systems and many that are new to the hobby give it up before they even really get started , because it is so difficult , if not impossible for them to make contacts . Don't get me wrong I have a beacon that runs 1 watt INPUT and several very low power kit or homebuilt 1 or 2 watt transmitters and have made tons of contacts with them . BUT I also use good antennas with them and I have 48 years experience as a ham.

Dale, the mylar speaker you suggested from Mouser came in today and I installed it, The speaker has a bit of a dome to it and doesn't sit down quite flush in the hole (because of the way the wires run), so I worried it might contact the top of the chassis. It looks like some of the board traces run very near the speaker hole, so I dared not open it up a bit. Well. luckily it does not seem to rub the top of the case and the audio sounds GREAT! Even with my old ears, I can hear things I don't believe I could have before, like papers rustling in the shack as someone talks on their microphone, Maybe It's just wishful (overly positive) thinking on my part, as I said, my ears are a little worse for six decades of use. Maybe propagation is especially clear today? Anyway, my opinion is that this is another great mod you have originated for the X1M. The sound is soooo clear!

THANKS

Hi Lee,
Mine arrived today also. I have not had an opportunity to do anything with them other than listen to it on the bench- not a fair test. They need an enclosure- like inside the X1M. Glad to hear they fit.

Yes Charlie this is one great group of guys. I was surprised at how quickly every responded. Put the little rig on the air tonight. Checked into the moonlighters net. My qth is southern Il, and I got S9's with great audio from Florida, Arkansas, and Tennessee. Also have Ham Radio Deluxe controlling the rig. I'm very pleased with the AGC Mod and am now thinking of upgrading the internal speaker.
Perhaps some time we can meetup with the X1M's. Regards, John. KC9YAW.

2444. Substitute RF power transistor

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-20 03:36:47 UTC
From: <disklog@...>
Topic: 2444 Message: 2444

I realize that a slight increase in transmit power means very little at the receive end, and I realize that antenna improvements make easier signal improvements at both ends BUT....
Having said that, please bear with me concerning this question.
It appears to me that the RF power transistor in these radios is a RD06HVF1 which has 13db gain. Considering that the output of these radios is about 4.5 watts, I am guessing that this 13db gain transistor is being driven with about 200mw. Someone please correct me if I am figuring this wrong.
For the sake of discussion, if we replace the 13db transistor with the direct replacement RD16HHF1, a 16db gain transistor, would the additional 3db gain give us around 9 watts output if driven with the same 200mw drive?
OK lets hear all the reasons why this won't work. :)
I have built many projects but my design skills are poor. I am hoping you all can help answer this question and maybe I can learn something.
Thanks, Ken

To to change the speaker you do need to remove the top board. These excellent videos describe the disassembly and re-assembly process. http://m.youtube.com/watch?v=Udc0Zf_HoxY http://m.youtube.com/watch?v=Udc0Zf_HoxY
http://m.youtube.com/watch?v=-y8DtALnZrM http://m.youtube.com/watch?v=-y8DtALnZrM

Once you have the top board removed, you disconnect the speaker where it is soldered. Then carefully remove the hot glue that holds the speaker in place and remove the speaker. If you got the speaker Dale recommends, take a look at it and notice that from the top you can see a ring of holes drilled in the metal. On the bottom, there is black fabric covering these holes so they are not visible, unless you shine a bright light through the speaker from the front. Do not block these holes when you hot glue the new speaker into the place the original speaker occupied. Make sure the new speaker sits as flat and low on the top board as possible. There is little room for the top cover to clear the new speaker "dome" once the radio is reassembled. I held the speaker in place with my hand and put a few blobs of hot glue on the back of the speaker anchoring it to the "bottom of the top board", being careful about those holes. One might mark the spots between the holes with a marker pen to make the glueing easier. Once the speaker was anchored on the bottom, I ran a bead of hot glue partially around the top, avoiding interfering with any surface mount parts. Solder the speaker wiring connections. Reassemble VERY carefully. At my age, I consider a magnifying visor essential for this job.

I held the speaker in place with my hand and put a few blobs of hot glue on the back of the speaker anchoring it to the "bottom of the top board", being careful about those holes. One might mark the spots between the holes with a marker pen to make the glueing easier. Once the speaker was anchored on the bottom, I ran a bead of hot glue partially around the top, avoiding interfering with any surface mount parts. Solder the speaker wiring connections. Reassemble VERY carefully. At my age, I consider a magnifying visor essential for this job.

Hi Victor,

it´s the same problem here in Germany.
Shipping cost are ridiculous high 20 EUR (about 20 $ US) for a 3 EUR speaker!
Ordered a Visaton K50 FL speaker which is looking similiar.

Andy, DC3AFA

Once you have the top board removed, you disconnect the speaker where it is soldered. Then carefully remove the hot glue that holds the speaker in place and remove the speaker. If you got the speaker Dale recommends, take a look at it and notice that from the top you can see a ring of holes drilled in the metal. On the bottom, there is black fabric covering these holes so they are not visible, unless you shine a bright light through the speaker from the front. Do not block these holes when you hot glue the new speaker into the place the original speaker occupied. Make sure the new speaker sits as flat and low on the top board as possible. There is little room for the top cover to clear the new speaker "dome" once the radio is reassembled. I held the speaker in place with my hand and put a few blobs of hot glue on the back of the speaker anchoring it to the "bottom of the top board", being careful about those holes. One might mark the spots between the holes with a marker pen to make the glueing easier. 2457. Firmware Update

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-20 21:53:35 UTC
From: <ed@...>
Topic: 2457 Message: 2457

The latest firmware update has been added to the Files Section.

This update changes the step of the RIT control and hopefully improves the CW operations.

This update is only for the X1M-Pro model. It will also work on the X1M models that have had their front panel upgraded.

2458. Re: [X1M_QRP-Transceiver] Firmware Update

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-20 22:11:40 UTC
From: Dale Parfitt
Topic: 2457 Message: 2458

I have tested the firmware and it looks to be spot on.
When in RIT mode the tuning control only effects RIT (that is you cannot QSY while in RIT) - but I am not certain that is a drawback at all. At any rate, because we do not have a dedicated RIT knob, this is the way it is going to work. I have no problem with it.

The issue with the very first CW element sent being on the RX frequency also appear to have bee 100% corrected. Listening on my K3, X1M's CW sounds very good indeed.

The ony feature we still don't have is the capability to dump the memory channel to the VFO. This would be a nice feature allowing rapid band change.

I would like some ops thoughts on a bit of a CW issue.. You may recall that initially CW Tone effected both RX and TX frequency- thus you could not offset the RX from the TX. The result being you and the station you were QSOing walked up and down the band (remember also that back then, RIT also effected RX and TX and split did not function in CW mode). So now CW Tone works fine.

Here is the issue as I see it- and where I would like some help as I may be missing something.
In order for the digital dial to read the correct CW frequency on RX, you have to set the CWBFO= IF OFFSET. This works. The result of doing this though, places the RX CW signal in the center of the xtal filter passband. This then means you will hear both sides of zero beat of incoming stations and you have to remember which side of zero beat to tune to in order to work a station. Does someone see a work around for this? Not a huge deal, but I would have no clue how to explain it to the designers.

And finally, many thanks to Ed who has really been pushing the gang in China to get new firmware changes accomplished.

Dumping the present memory channel into the VFO is something I have just passed along to the factory for the second time. Them speaking no English makes these things a little difficult to explain but hopefully they will understand and it will be something that can be added.

For the explanation of the CW zero beat, that one will be tough. I'm open to suggestions on how to explain it.

From: <lphebus@...>
Topic: 2444 Message: 2462

It seems to me that you may be the local expert on this subject... What you are saying seems reasonable enough, provided the rest of the circuitry (inductors, power suply etc) is up to the task. I doubt the Chinese designers are going to chime in (if only because of the language barrier), although in my opinion they must be quite skilled to produce such a good radio at such a reasonable cost. Of course, the work by our local experts has really improved the basic package. For me, this radio is all about experimentation. The radio is not ALL THAT EXPENSIVE (I emphasize because this depends on your current situation), so modifications with bad outcomes are not all that disastrous. Besides, you could probably repair any damage done??? I guess the theme is "modify at your own risk"... but keep us informed so the entire group can learn. Best of luck!!!

---In X1M_QRP-Transceiver@yahoogroups.com, <disklog@...> wrote:

I realize that a slight increase in transmit power means very little at the receive end, and I realize that antenna improvements make easier signal improvements at both ends BUT....
Having said that, please bear with me concerning this question.
It appears to me that the RF power transistor in these radios is a RD06HVF1 which has 13db gain. Considering that the output of these radios is about 4.5 watts, I am guessing that this 13db gain transistor is being driven with about 200mw. Someone please correct me if I am figuring this wrong.
For the sake of discussion, if we replace the 13db transistor with the direct replacement RD16HHF1, a 16db gain transistor, would the additional 3db gain give us around 9 watts output if driven with the same 200mw drive?
OK lets hear all the reasons why this won't work. :)
I have built many projects but my design skills are poor. I am hoping you all can help answer this question and maybe I can learn something.
Thanks, Ken

Hi Ken ,

It does look like a possible device for the experimenters to work with
and try out .
I still have what I consider a major disadvantage and that is I need a
wall size schematic of the X1M , since it is extremely difficult to work
with all of the small pieces on the computer . My eyesight is poor and I
sometimes have memory issues of maintaining continuity of thought
beginning to end doing it piece by piece . I would love to have two
large schematics , one to hang on the wall and one to put on the bench .
I also have not studied the datasheets . Direct replacement doesn't
always equate to a direct replacement for all applications .
I would look at the X1M power supply to the final also to make certain
that the radio can handle that part of it too .
I do find areas where the X1M seems to push certain elements of the
various power systems a little harder than I normally do in my designs .
How expensive are the transistors and how difficult are they to obtain ?
I haven't done any research at all on this matter , but it certainly
could be of interest to some of the users on here .
Perhaps later this evening I'll pull up the data sheets and have a look .
Interesting subject for the experimenters on here .

I am waiting for delivery of my pro and look forward to using it and modifying it. My track record has been to take brand new equipment and modify it thereby voiding the warranty. I may wait a bit with this radio to insure it has no delivered faults.
The transistors in question are very cheap and available so once modified I will report the results. Hopefully it will be a better experience than my last on-line HF radio purchase. That radio was received missing the entire power amp board. I had a great 40mw hf radio, but no real power. It was an ebay purchase that the seller eventually gave me a partial refund of $100.
I them built an entire RF power amp board from scratch using a recent QST design. It works flawlessly.
This time I am buying NEW so hopefully no surprises.

Charlie,
The RD16hhf1 is a 16db gain, 16watt minimum transistor when driven from 400mw. They are $5.30 each and available many many places.
It appears that the final transistor sits on the 12v line but I will have to verify it when I get the radio and determine if any questionable traces or parts are involved.
I know such a small increase in RF power means little but if one incurs RF loses in a tuner etc, this might make that up. Not of great importance but for the price I just have to find out.

at both ends
BUT....

Having said that, please bear with me
concerning this
question.

It appears to me that the RF power transistor
in these
radios is a RD06HVF1 which has 13db gain.
Considering
that the output of these radios is about 4.5
watts, I am
guessing that this 13db gain transistor is
being driven
with about 200mw. Someone please correct me if
I am
figuring this wrong.

For the sake of discussion, if we replace the
13db
transistor with the direct replacement
RD16HHF1, a 16db

gain transistor, would the additional 3db gain
give us
around 9 watts

output if driven with the same 200mw drive?

OK lets hear all the reasons why this
won't work. :)

I have built many projects but my design
skills are poor.
I am hoping you all can help answer this
question and
maybe I can learn something.

Thanks, Ken

2466. Xiegu Audio Filter

Has anyone played around with the Xiegu Audio Filter? I think it was designed for CW but works a little on SSB. I'm am trying to see if there is some way to make mine better on SSB. Years ago I put a BHI DSP in my FT-817 but they are expensive, $159, and I understand the audio filter will not work as good as a digital one. I did figure out the this filter looks like a knock-off of the NESCAF kit offered by NEQRP, New England QRP. They still sell them and you can download the schematic and manual at http://newenglandqrp.org/nescaf http://newenglandqrp.org/nescaf . Are there any opinions on possible mods. I built one but had problems getting it working so I bought the Xiegu filter.

Hi Ken ,

I'll probably order some to keep here in my MOSFET collection . That is about the only amps I have time to play with these days . It is a good thought Ken and I do hope that it works out . We can relax now and enjoy the heck out of this very fine little radio and also now spend our time doing mods and accessories for it !! I have a hard time keeping current with all of the devices available out there these days . I am glad you did the research .

I agree with Lee / 7 this radio is made for experimenting and now more people can concentrate on experimenting and mods , since we have so many of the original issues now resolved . It is now a lot more radio , than what most of us thought that we were buying . The company has done a really great job of making a great little radio out of this and I don't even need to add "for the price these days" , because it can well stand alone on its own merits .

I was like Lee and bought it as an experimental radio and while I would have been slightly upset if I had a failure while working on it these past few months , like Lee said it could have been completely lost and not been a huge hit in the budget like some radios would be . Don't get me wrong , I don't have a lot of money for my radio budget and what little I do have usually goes to parts so I can build something . The price and the intrigue of this little radio made me buy it and it is the first new ham rig that I have been able to buy in many years . He is also correct , unless one makes a huge error or mistake , you can usually repair this one too .

Perfect radio all around for everyday use and for experimenting without the fear of going bankrupt :)

I am going to look around and see if I can pick up a few of those transistors to have on hand .

GREAT to see another experimenter and builder on here . Hope you all get your radios soon . Can't wait to read all of the feedback now that it is a complete working radio and that there is still going to be ongoing firmware upgrades . I have a feeling this may become one of the most popular radios ever sold and that the company is going to have a hard time keeping up with production . It is going to enjoy a nice long life and be very popular once the word gets out to more people about just how far it has come and what a buy it is !! I don't even see the slightest hint of ANY radio , kit or assembled on even the far off horizon that can even begin to compete with this one . A LOT of companies have a LOT of cost cutting to do and a LOT of catching up to do to compete with this !!

Hey Bill ,

I looked at that particular amp just the other day , for another application . Now those guys put out some VERY FINE projects and products !!! I just didn't pay any attention to the active device in it . THANKS for pointing that out .

It won't fit in my budget right now , but I can build something similar .

This time of year usually finds me on the frequencies below 2 MHz. where I do a lot of experimenting and am right now working on a new design of mine for a 600 / 630 meter transverter .

Will have to read their information again . They have a nice little operation going there , I would like to have a similar operation with just a very few products that I could concentrate on .

Hi Lee ,

I have the Xiegu Audio Filter , but have used it very little on SSB . I like it when I am working CW and it is even a big help on my FT-857 bare bones with no filters .

I agree that the filter appears to be a close copy of the NESCAF filter . I have not done any experimenting at all with the filter and any possible mods or changes for it .

Now that we have a stable version of a radio that is working quite well , now there is more time to start working on mods and accessories for the X1M . Plus when this shipment comes in we will have a larger group of people that can add some new eyes and ideas for us to play with .

Maybe I can take a shot at explaining desired CW operation.

1. With the RIT turned off, the frequency displayed in both transmit and receive should be the frequency that the CW carrier is transmitted on.

2. For CW operation, the receiver BFO frequency should be left as for upper sideband operation. The BFO frequency should be outside the receive bandpass. The receive frequency is shifted down by 600 to 1000 Hz from the displayed frequency so that a received CW signal on the displayed frequency will be in the receive IF filter bandpass.

3. As and example: Operating CW on 7.100 MHz. The transceiver should display 7.100 MHz in both transmit and receive. When we press the CW key, the transceiver should produce a carrier at exactly 7.100000 MHz. Assume we wish to hear other signals on 7.100 MHz at an audio pitch of 800 Hz. In receive, the transceiver will be tuned to 7.100 MHz minus 800 Hz which is 7.099200 MHz but still displaying 7.100 MHz.

4. The CW transmit and receive frequency is not placed in the center of the receive filter bandpass when using SSB width IF filters. That would require an on frequency receive signal to produce a 1500 Hz pitch tone which is very harsh for extended receiving.

Does that make sense?

Gary - N0GW

---In X1M_QRP-Transceiver@yahoogroups.com, <ed@...> wrote:

Dumping the present memory channel into the VFO is something I have just passed along to the factory for the second time. Them speaking no English makes these things a little difficult to explain but hopefully they will understand and it will be something that can be added.

For the explanation of the CW zero beat, that one will be tough. I'm open to suggestions on how to explain it.

☐
I have tested the firmware and it looks to be spot on.
When in RIT mode the tuning control only effects RIT (that is you cannot QSY while in RIT) - but I am not certain that is a drawback at all. At any rate, because we do not have a dedicated RIT knob, this is the way it is going to work. I have no problem with it.

The issue with the very first CW element sent being on the RX frequency also appear to have bee 100% corrected. Listening on my K3, X1M's CW sounds very good indeed.

The ony feature we still don't have is the capability to dump the memory channel to the VFO. This would be a nice feature allowing rapid band change.

I would like some ops thoughts on a bit of a CW issue.. You may recall that initially CW Tone effected both RX and TX frequency- thus you could not offset the RX from the TX. The result being you and the station you were QSOing walked up and down the band (remember also that back then, RIT also effected RX and TX and split did not function in CW mode). So now CW Tone works fine.

Here is the issue as I see it- and where I would like some help as I may be missing something.
In order for the digital dial to read the correct CW frequency on RX, you have to set the CWBFO= IF OFFSET. This works. The result of doing this though, places the RX CW signal in the center of the xtal filter passband. This then means you will hear both sides of zero beat of incoming stations and you have to remember which side of zero beat to tune to in order to work a station. Does someone see a work around for this? Not a huge deal, but I would have no clue how to explain it to the designers.

And finally, many thanks to Ed who has really been pushing the gang in China to get new firmware changes accomplished.

Dale W4OP

Subject: [X1M_QRP-Transceiver] Firmware Update

The latest firmware update has been added to the Files Section.

This update changes the step of the RIT control and hopefully improves the CW operations.

This update is only for the X1M-Pro model. It will also work on the X1M models that have had their front panel upgraded.

Works fine with my Palomar converter. The transverter may be the answer.
Interesting PA transistor discussion. 10W would be nice. I'll sit on the sidelines and see how this plays out.

Perfect radio all around for everyday use and for experimenting without the fear of going bankrupt :)

I am going to look around and see if I can pick up a few of those transistors to have on hand .

GREAT to see another experimenter and builder on here . Hope you all get your radios soon . Can't wait to read all of the feedback now that it is a complete working radio and that there is still going to be ongoing firmware upgrades . I have a feeling this may become one of the most popular radios ever sold and that the company is going to have a hard time keeping up with production . It is going to enjoy a nice long life and be very popular once the word gets out to more people about just how far it has come and what a buy it is !! I

don't even see the slightest hint of ANY radio , kit or assembled on even the far off horizon that can even begin to compete with this one . A LOT of companies have a LOT of cost cutting to do and a LOT of catching up to do to compete with this !!

Charlie , W5COV

Charlie,
The RD16hhf1 is a 16db gain, 16watt minimum transistor when driven from 400mw. They are $5.30 each and available many many places.
It appears that the final transistor sits on the 12v line but I will have to verify it when I get the radio and determine if any questionable traces or parts are involved.
I know such a small increase in RF power means little but if one incurs RF loses in a tuner etc, this might make that up. Not of great importance but for the price I just have to find out.

Hi Ken ,

It does look like a possible device for the
experimenters to work
with and try out .

I still have what I consider a major disadvantage and
that is I need
a wall size schematic of the X1M , since it is extremely
difficult
to work with all of the small pieces on the computer .
My eyesight
is poor and I sometimes have memory issues of
maintaining continuity
of thought beginning to end doing it piece by piece . I
would love
to have two large schematics , one to hang on the wall
and one to
put on the bench .

I also have not studied the datasheets . Direct
replacement doesn't
always equate to a direct replacement for all
applications .

I would look at the X1M power supply to the final also
to make
certain that the radio can handle that part of it too .

I do find areas where the X1M seems to push certain
elements of the
various power systems a little harder than I normally do
in my
designs .

How expensive are the transistors and how difficult are
they to
obtain ? I haven't done any research at all on this
matter , but it
certainly could be of interest to some of the users on
here .

Perhaps later this evening I'll pull up the data
sheets and have a
look .

Interesting subject for the experimenters on here .

wrote:

I realize that a slight increase in transmit
power means
very little at the receive end, and I realize
that antenna
improvements make easier signal improvements
at both ends
BUT....

Having said that, please bear with me
concerning this
question.

It appears to me that the RF power transistor
in these
radios is a RD06HVF1 which has 13db gain.
Considering
that the output of these radios is about 4.5
watts, I am
guessing that this 13db gain transistor is
being driven
with about 200mw. Someone please correct me if
I am
figuring this wrong.

For the sake of discussion, if we replace the
13db
transistor with the direct replacement

RD16HHF1, a 16db
gain transistor, would the additional 3db gain
give us
around 9 watts

output if driven with the same 200mw drive?

OK lets hear all the reasons why this
won't work. :)

I have built many projects but my design
skills are poor.
I am hoping you all can help answer this
question and
maybe I can learn something.

Thanks, Ken

2476. CW setup issue

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-21 05:34:56 UTC
From: Dale Parfitt
Topic: 2476 Message: 2476

It all makes perfect sense Gary- and is exactly as I think it should be. The issue is that set up that way (CW BFO=USB BFO), the RX frequency as displayed on the freq readout is not correct. The only way to get the RX frequency to be correct is to set the CW BFO= IF OFFSET, and the CW signal is now centered in the filter (not where one wants it) . I agree that the CW signal when tuned to the tone you have set in menu should be off the skirt on the filter.

Have you set up your rig for CW? Perhaps mine is behaving differently than yours?

Subject: RE: RE: Re: [X1M_QRP-Transceiver] Firmware Update

Maybe I can take a shot at explaining desired CW operation.

1. With the RIT turned off, the frequency displayed in both transmit and receive should be the frequency that the CW carrier is transmitted on.

2. For CW operation, the receiver BFO frequency should be left as for upper sideband operation. The BFO frequency should be outside the receive bandpass. The receive frequency is shifted down by 600 to 1000 Hz from the displayed frequency so that a received CW signal on the displayed frequency will be in the receive IF filter bandpass.

3. As and example: Operating CW on 7.100 MHz. The transceiver should display 7.100 MHz in both transmit and receive. When we press the CW key, the transceiver should produce a carrier at exactly 7.100000 MHz. Assume we wish to hear other signals on 7.100 MHz at an audio pitch of 800 Hz. In receive, the transceiver will be tuned to 7.100 MHz minus 800 Hz which is 7.099200 MHz but still displaying 7.100 MHz.

4. The CW transmit and receive frequency is not placed in the center of the receive filter bandpass when using SSB width IF filters. That would require an on frequency receive signal to produce a 1500 Hz pitch tone which is very harsh for extended receiving.

Does that make sense?

☐

I have tested the firmware and it looks to be spot on.
When in RIT mode the tuning control only effects RIT (that is you cannot QSY while in RIT) - but I am not certain that is a drawback at all. At any rate, because we do not have a dedicated RIT knob, this is the way it is going to work. I have no problem with it.

The issue with the very first CW element sent being on the RX frequency also appear to have bee 100% corrected. Listening on my K3, X1M's CW sounds very good indeed.

The ony feature we still don't have is the capability to dump the memory channel to the VFO. This would be a nice feature allowing rapid band change.

I would like some ops thoughts on a bit of a CW issue.. You may recall that initially CW Tone effected both RX and TX frequency- thus you could not offset the RX from the TX. The result being you and the station you were QSOing walked up and down the band (remember also that back then, RIT also effected RX and TX and split did not function in CW mode). So now CW Tone works fine.

Here is the issue as I see it- and where I would like some help as I may be missing something.
In order for the digital dial to read the correct CW frequency on RX, you have to set the CWBFO= IF OFFSET. This works. The result of doing this though, places the RX CW signal in the center of the xtal filter passband. This then means you will hear both sides of zero beat of incoming stations and you have to remember which side of zero beat to tune to in order to work a station. Does someone see a work around for this? Not a huge deal, but I would have no clue how to explain it to the designers.

And finally, many thanks to Ed who has really been pushing the gang in China to get new firmware changes accomplished.

Subject: [X1M_QRP-Transceiver] Firmware Update

The latest firmware update has been added to the Files Section.

This update changes the step of the RIT control and hopefully improves the CW operations.

This update is only for the X1M-Pro model. It will also work on the X1M models that have had their front panel upgraded.

WOW yes far too much shipping Victor !!! I have no ideas on a solution , since I no longer work in anything related to shipping outside of the states .

I am on the Mouser site right now getting ready to order one . Unfortunately they do not have that MOSFET transistor and some other parts that I need to order have gone up so much in price I can't afford to order them from them , but am going to have to resort to eBay . So now I am trying to buy enough parts that I can use to make the order worthwhile .

Do you know of any possible solutions that any of us on the group could help you with ?

Perhaps later this evening I'll pull up the data
sheets and have a
look .

Interesting subject for the experimenters on here .

improvements make easier signal improvements
at both ends
BUT....

Having said that, please bear with me
concerning this
question.

It appears to me that the RF power transistor
in these
radios is a RD06HVF1 which has 13db gain.
Considering
that the output of these radios is about 4.5
watts, I am
guessing that this 13db gain transistor is
being driven
with about 200mw. Someone please correct me if
I am
figuring this wrong.

For the sake of discussion, if we replace the
13db
transistor with the direct replacement
RD16HHF1, a 16db
gain transistor, would the additional 3db gain
give us
around 9 watts

output if driven with the same 200mw drive?

OK lets hear all the reasons why this
won't work. :)

I have built many projects but my design
skills are poor.
I am hoping you all can help answer this
question and
maybe I can learn something.

Thanks, Ken

2480. Parts Question

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-21 06:28:12 UTC
From: Charlie , W5COV
Topic: 2480 Message: 2480

Okay , I thought that I ordered quite a few "common parts."

Am I doing something wrong (highly possible) or are some of these what I consider common parts , becoming obsolete this quickly ?

I am looking for C0G or NP0 leaded capacitors on Mouser . What I am seeing is extremely slim picking and some really expensive for what I don't consider a high dollar part . Tons and tons of them in Surface Mount . Almost none , at least on a couple that I started out looking for in leaded radial . The first one was a 2,000 pF. Many are shown as non stocked , some show stock levels in the single digits . The 1% one that I found was $12.00 !!

I don't like to buy my capacitors on eBay , because well in excess of 90 % of them are from a foreign supplier , usually China . I don't have a problem buying China parts for most applications , but in this case I need them in an RF application and they never clearly state that they are indeed NP0 or C0G and I am trying very hard to improve the quality of parts that I keep on hand . Also the lead time from China can seem like forever when you are building a project .

Luckily in this case I was trying to replace and add stock . I do have silver micas on hand so it isn't going to slow my building so far on this particular project . I haven't checked all of the values that I need since I have made design changes to this project in the past week . Since I am also an old tube guy , hopefully I have all of the values that I need in stock of good quality capacitors .

So what is everyone else that is a builder / homebrewer doing on parts today for non surface mount projects ?

Maybe one day we will come up with a project that almost everyone just has to have and we can do a group buy . Mouser usually offers some substantial price cuts in lot of 10 and some the break is at 25 , but it is usually big enough to justify at least me , buying the larger quantity , since it is nice to have all of the parts on hand when I decide to build a project .

Maybe I'll put the order off until tomorrow so I can come up with a good list to fill up on parts that I am low on and see if there are some new ones I need to have on hand .

Charlie , W5COV

Charlie,
The RD16hhf1 is a 16db gain, 16watt minimum transistor when driven from 400mw. They are $5.30 each and available many many places.
It appears that the final transistor sits on the 12v line but I will have to verify it when I get the radio and determine if any questionable traces or parts are involved.
I know such a small increase in RF power means little but if one incurs RF loses in a tuner etc, this might make that up. Not of great importance but for the price I just have to find out.

Hi Ken ,

It does look like a possible device for the
experimenters to work
with and try out .

I still have what I consider a major disadvantage and
that is I need
a wall size schematic of the X1M , since it is extremely
difficult
to work with all of the small pieces on the computer .
My eyesight
is poor and I sometimes have memory issues of
maintaining continuity
of thought beginning to end doing it piece by piece . I
would love
to have two large schematics , one to hang on the wall
and one to
put on the bench .

I also have not studied the datasheets . Direct
replacement doesn't

always equate to a direct replacement for all
applications .

I would look at the X1M power supply to the final also
to make
certain that the radio can handle that part of it too .

I do find areas where the X1M seems to push certain
elements of the
various power systems a little harder than I normally do
in my
designs .

How expensive are the transistors and how difficult are
they to
obtain ? I haven't done any research at all on this
matter , but it
certainly could be of interest to some of the users on
here .

Perhaps later this evening I'll pull up the data
sheets and have a
look .

Interesting subject for the experimenters on here .

Thanks Dale , I really appreciate that . Is 10 MHz. IF okay for you ? I have a couple of spare OCXO's for there , so we should have the stability we need . Later I will build a SMD model since I also have some 2.5ppm TCXO's here and it looks like I will have no problem sourcing high quality SMD parts to build a tiny model with , I also have several AADE and Mini Circuits SMD mixers , so I have plenty of good high quality parts to build up a couple of different models .

I only have one BCB station close enough to me to be of any real concern at all . It operates from 6 a.m. until midnight . It runs 10,000 watts daytime and 5,000 watts night time and the transmitter is about 20 or 25 miles from me . I have never really had many issues with it .

Yes the beacon is on . I'll go back and check the loading .

At Mouser, click on:
All Products > Xicon > Passive Components > Capacitors > Ceramic Capacitors > Ceramic Disc Capacitors
Look in Class I 5%
They run around 10 cents in single quantities.

Bill , that was my thought also . We have people on here from all over the world . I just don't do enough shipping either foreign or domestic to know who might be in the best position to do that . I have no idea what it would cost to ship from here . If Mouser is not making a markup on the shipping , I would assume it would cost me the same as them to ship to him . I will try to remember to check at the post office tomorrow to see what the shipping would be from here .

I think we can safely assume that Mouser etc are making huge mark-ups on international shipping to some destinations, Charlie. I have organised a number of international group-buys, from here in Australia, and never have the costs of postage approached the shipping costs required by major component suppliers.

A related problem is that many suppliers use standard size packages, regardless of what is inside. I have one package I am keeping as a souvenire. It is about 16 inches x 10 inches x 1 inch. Inside was one rotary encoder, smaller than an audio potentiometer. The cost of shipping? More than is now being asked of Victor. and being stupid but really wanting the encoder, I paid it!

Never again.

On occasions, I have accepted an offer by international hams to act as intermediate shipping destinations. They have taken advantage of cheap domestic postage, then posted on to me at cost. Usually heaps cheaper than direct shipping from the original supplier.

2488. X1M SERVICE MANUAL (LONG)

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-21 09:01:11 UTC
From: Charlie , W5COV
Topic: 2488 Message: 2488

Well I have the transistors ordered but chose the slow boat from China to get them , so it will take them a while to get here . I have really slipped way behind on my projects over the summer and working with the X1M.

I am also needing to stock up my parts bins with some better quality parts , especially capacitors , so I can make low pass filters for any band the X1M covers and to save a little time , I am going to draw up some boards so it will save time to put a filter together .

I am also working on building a couple of new transverters to allow people an easy way to get on 600/630 meters with basically any newer radio .

Still on my list is getting a large size full schematic of the X1M made up . Living in a rural area we don't have any of those chain stores that specialize in printing and with my limited mobility it is pretty difficult to get to even a city large enough to see if they can do what I want . I am at least and hours drive from any place that might do that kind of work . Maybe some of the huge influx of new X1M owners we are going to see when all of the distributors get their orders in from this production run , we will have someone that is in the printing or graphics business that can do that . I have no idea how many total radios that there are in a production run , but I would guess in the hundreds so we should have a nice increase in people with different abilities .

I come up with a few crazy ideas every once in a while . I would like to see if we can't create at least a start on a kind of a service manual for this radio . It will by no means be a true comprehensive service manual , but I have zero doubts that we can put together a very decent technical manual with voltages and parts identifications that may indeed be of benefit in the event that one of us needs to troubleshoot or repair their radio . Do you know of ANY service centers once the warranty is up ? I don't .

I have never written anything except technical manuals and plans that don't in any way relate to radio and electronics troubleshooting .

A few basic things that I think we will need , is a good photographer , or even more than one , to photograph and identify different boards and different areas of the boards and be able to label as many components as possible to help people orient where they are on the board and which board that they are on .

Naturally we would need several people involved . Say for instance to take voltage readings on each of the components , in both the receive and transmit mode . We would specify the mode too for the readings . We could decide first on a very general manual and choose some frequency

and a specific set of settings that everyone would use as the "initial standard" from where everyone bases the readings that they take . A good Bill of Materials for the components actually installed in the radio . Many times schematics do not get updated to a true "as built" radio . It is no small undertaking , but you could be the one that needs it first and it could save you from having a radio that just turns into a shelf piece . Another set of ohm meter readings in several places could be of benefit also to help you at least get in the right area to troubleshoot . One of the main things is getting 2 or 3 people that collect the data and then place it on the schematics and or a chart or spreadsheet for each particular section . At first just having voltage and ohm meter readings would be a good starting point , along with photos tagged with component identification . Paul is very organized and has a great deal of writing experience , so having him involved would certainly be a huge help . There is room for everyone who wants to volunteer on a project like this .

Okay now that you know I am a case for a mental ward , if you think we can pull off any version of this and add to it as we go along and want to join me at the funny farm , give it a little thought and make a comment on what you might be able to contribute to this project . Maybe we can start a list in the files section , like I did for the volunteer builders of any and all of you willing to contribute to such a project in any manner and if it is more than just me , we can get a little better organized and get started on this project which will be very fluid .

I also am not sure just how much space we are allowed on a Yahoo group , but this could get fairly large with pictures , especially down the line if we add scope , frequency counter , spectrum analyzer pictures etc. so hopefully in the end we can actually call it a service manual and maybe strive to make it even a little better than an "average service manual" like from the BIG THREE and others . Hopefully someone with very little electronics knowledge can find and effect a repair on their own . If it turns out as well as I hope it will we might have to have web page for it , especially since we don't want to run out of room on our Yahoo home page .

I can't even figure out how to write me a personal web page since my brain damage , so we would certainly need someone to take the lead on that , since I am completely useless even to myself when it comes to web pages :)

Also we need an area for people that have had problems and what they did to resolve them .

Just a crazy idea , but one I would love to see come to fruition in some form or another . It doesn't have to take the path that I have suggested and if you have ideas on a better way to do it PLEASE don't be shy !! I really do think something more than an operators manual would be used by pretty much everyone at some point in time .

Best 73 , Charlie , W5COV

I agree Bill , I have a feeling Mouser is making a killing at that kind of shipping cost . In years past , when I was very active , I also have acted as the intermediate shipping destination . Since I am preparing a good sized order for myself from Mouser , I thought that perhaps if the shipping cost to Victor from here was within reason , that I would be more than happy to ship it to him and help out a fellow ham and save him some money and he would get his speaker like all of the rest of us .

I am sure that there are certain items in other countries from time to time , that I could use here and if having a "local' ham pick it up and ship it to me was much cheaper , I would certainly be grateful to have someone do that for me .

I am an "old school" ham and also in my personal life , where if I can help someone else out , I am more than happy to do so . I was brought up in a ham community , where it was an unwritten rule that hams helped hams.

I am very hopeful that we can get Victor a speaker and get it shipped to him for a reasonable cost .

What is your setup going to be over there Bill ? I haven't yet worked Australia X1M to X1M .

The best antenna that I am running here is on 17 meters . I am running an HF 17 METER "OMNIANGLE" , which is an antenna manufactured by a company here in the USA , that is owned and operated by one of our very own X1M group members , Dale , W4OP . Here is a link to his page for this particular line of antennas that he manufactures : http://www.parelectronics.com/hf-omnis.php It is horizontally polarized and is a TRUE Omni Directional Antenna . No rotor needed .

His company also manufactures other antennas and products and he has made countless changes to improve the X1M from its inception . He is the one that developed the AGC kit for the X1M . He is also the original designer of the Par EFHW super popular antenna , worldwide. A true favorite of QRP and portable operators . He has since sold that particular line of antennas to LNR Precision , as he continues to develop new antennas and products .

The X1M doesn't come with 17 meters as one of the bands with an internal factor low pass filter so I have an external low pass filter that I built .

Probably our next best choice of bands is 20 meters . I use a G5RV multiband antenna on 20 and rarely have any problems working DX with it even though it is not as high as I would like or quite as good of an antenna . Come spring time I plan on adding more of Dale's Omniangles and both 20 meters and 6 meters are at the top of the list .

I also have the filter. I'm waiting for my radio to come in so I've used it on my 857. Well worth the money. It does a good job in SSB. I would recommend it for both modes.

Subject: RE: RE: Re: [X1M_QRP-Transceiver] Firmware Update

Maybe I can take a shot at explaining desired CW operation.

1. With the RIT turned off, the frequency displayed in both transmit and receive should be the frequency that the CW carrier is transmitted on.

2. For CW operation, the receiver BFO frequency should be left as for upper sideband operation. The BFO frequency should be outside the receive bandpass. The receive frequency is shifted down by 600 to 1000 Hz from the displayed frequency so that a received CW signal on the displayed frequency will be in the receive IF filter bandpass.

3. As and example: Operating CW on 7.100 MHz. The transceiver should display 7.100 MHz in both transmit and receive. When we press the CW key, the transceiver should produce a carrier at exactly 7.100000 MHz. Assume we wish to hear other signals on 7.100 MHz at an audio pitch of 800 Hz. In receive, the transceiver will be tuned to 7.100 MHz minus 800 Hz which is 7.099200 MHz but still displaying 7.100 MHz.

4. The CW transmit and receive frequency is not placed in the center of the receive filter bandpass when using SSB width IF filters. That would require an on frequency receive signal to produce a 1500 Hz pitch tone which is very harsh for extended receiving.

Does that make sense?

Dumping the present memory channel into the VFO is something I have just passed along to the factory for the second time. Them speaking no English makes these things a little difficult to explain but hopefully they will understand and it will be something that can be added.

For the explanation of the CW zero beat, that one will be tough. I'm open to suggestions on how to explain it.

>When in RIT mode the tuning control only effects RIT (that is you cannot QSY while in RIT) - but I am not certain that is a drawback at all. At any rate, because we do not have a dedicated RIT knob, this is the way it is going to work. I have no problem with it.
>
>The issue with the very first CW element sent being on the RX frequency also appear to have bee 100% corrected. Listening on my K3, X1M's CW sounds very good indeed.
>
>The ony feature we still don't have is the capability to dump the memory channel to the VFO. This would be a nice feature allowing rapid band change.
>
>I would like some ops thoughts on a bit of a CW issue.. You may recall that initially CW Tone effected both RX and TX frequency- thus you could not offset the RX from the TX. The result being you and the station you were QSOing walked up and down the band (remember also that back then, RIT also effected RX and TX and split did not function in CW mode). So now CW Tone works fine.
>
>Here is the issue as I see it- and where I would like some help as I may be missing something.
>In order for the digital dial to read the correct CW frequency on RX, you have to set the CWBFO= IF OFFSET. This works. The result of doing this though, places the RX CW signal in the center of the xtal filter passband. This then means you will hear both sides of zero beat of incoming stations and you have to remember which side of zero beat to tune to in order to work a station. Does someone see a work around for this? Not a huge deal, but I would have no clue how to explain it to the designers.

Topic: 2480 Message: 2493

About 3/4 of the way down the page, at the bottom of the 20W HF amp section, these guys are selling 500 Volt mica caps for LPFs. I don't know how the prices compare to big venders.

---In X1M_QRP-Transceiver@yahoogroups.com, <cvest@...> wrote:

Okay , I thought that I ordered quite a few "common parts."

Am I doing something wrong (highly possible) or are some of these what I consider common parts , becoming obsolete this quickly ?

I am looking for C0G or NP0 leaded capacitors on Mouser . What I am seeing is extremely slim picking and some really expensive for what I don't consider a high dollar part . Tons and tons of them in Surface Mount . Almost none , at least on a couple that I started out looking for in leaded radial . The first one was a 2,000 pF. Many are shown as non stocked , some show stock levels in the single digits . The 1% one that I found was $12.00 !!

I don't like to buy my capacitors on eBay , because well in excess of 90 % of them are from a foreign supplier , usually China . I don't have a problem buying China parts for most applications , but in this case I need them in an RF application and they never clearly state that they are indeed NP0 or C0G and I am trying very hard to improve the quality of parts that I keep on hand . Also the lead time from China can seem like forever when you are building a project .

Luckily in this case I was trying to replace and add stock . I do have silver micas on hand so it isn't going to slow my building so far on this particular project . I haven't checked all of the values that I need since I have made design changes to this project in the past week . Since I am also an old tube guy , hopefully I have all of the values that I need in stock of good quality capacitors .

So what is everyone else that is a builder / homebrewer doing on parts today for non surface mount projects ?

Maybe one day we will come up with a project that almost everyone just has to have and we can do a group buy . Mouser usually offers some substantial price cuts in lot of 10 and some the break is at 25 , but it is usually big enough to justify at least me , buying the larger quantity , since it is nice to have all of the parts on hand when I decide to build a project .

Maybe I'll put the order off until tomorrow so I can come up with a good list to fill up on parts that I am low on and see if there are some new

ones I need to have on hand .

From: <wescom@...>
Topic: 2476 Message: 2494

First, nope I don't have an XM1. I have been monitoring this info to decide when to order one. The CW setup issue has been a concern of mine.

Actually, what I was describing was how I would like to see the transceiver operate in CW mode in a way that the manufacturer's engineers might be able to understand unambiguously. I'm guessing none of the folks working on the software for this radio are CW operators. The hardware appears to be capable of operating correctly once some small tweaks are made to the software to correct operation in CW mode.

So, you are correct: BFO set the same as for SSB operation but the frequency displayed during receive should be offset to indicate the transmit frequency. This should be a very minor change to the radio's software.

Gary - N0GW

---In X1M_QRP-Transceiver@yahoogroups.com, <parinc1@...> wrote:

☐ It all makes perfect sense Gary- and is exactly as I think it should be. The issue is that set up that way (CW BFO=USB BFO), the RX frequency as displayed on the freq readout is not correct. The only way to get the RX frequency to be correct is to set the CW BFO= IF OFFSET, and the CW signal is now centered in the filter (not where one wants it) . I agree that the CW signal when tuned to the tone you have set in menu should be off the skirt on the filter.

Have you set up your rig for CW? Perhaps mine is behaving differently than yours?

Subject: RE: RE: Re: [X1M_QRP-Transceiver] Firmware Update

Maybe I can take a shot at explaining desired CW operation.

1. With the RIT turned off, the frequency displayed in both transmit and receive should be the frequency that the CW carrier is transmitted on.

2. For CW operation, the receiver BFO frequency should be left as for upper sideband operation. The BFO frequency should be outside the receive bandpass. The receive frequency is shifted down by 600 to 1000 Hz from the displayed frequency so that a received CW signal on the displayed frequency will be in the receive IF filter bandpass.

3. As and example: Operating CW on 7.100 MHz. The transceiver should display 7.100 MHz in both transmit and receive. When we press the CW key, the transceiver should produce a carrier at exactly 7.100000 MHz. Assume we wish to hear other signals on 7.100 MHz at an audio pitch of 800 Hz. In receive, the transceiver will be tuned to 7.100 MHz minus 800 Hz which is 7.099200 MHz but still displaying 7.100 MHz.

4. The CW transmit and receive frequency is not placed in the center of the receive filter bandpass when using SSB width IF filters. That would require an on frequency receive signal to produce a 1500 Hz pitch tone which is very harsh for extended receiving.

Does that make sense?

Gary - N0GW

---In X1M_QRP-Transceiver@yahoogroups.com, <ed@...> wrote:

Dumping the present memory channel into the VFO is something I have just passed along to the factory for the second time. Them speaking no English makes these things a little difficult to explain but hopefully they will understand and it will be something that can be added.

For the explanation of the CW zero beat, that one will be tough. I'm open to suggestions on how to explain it.

I have tested the firmware and it looks to be spot on.
When in RIT mode the tuning control only effects RIT (that is you cannot QSY while in RIT) - but I am not certain that is a drawback at all. At any rate, because we do not have a dedicated RIT knob, this is the way it is going to work. I have no problem with it.

The issue with the very first CW element sent being on the RX frequency also appear to have bee 100% corrected. Listening on my K3, X1M's CW sounds very good indeed.

The ony feature we still don't have is the capability to dump the memory channel to the VFO. This would be a nice feature allowing rapid band change.

I would like some ops thoughts on a bit of a CW issue.. You may recall that initially CW Tone effected both RX and TX frequency- thus you could not offset the RX from the TX. The result being you and the station you were QSOing walked up and down the band (remember also that back then, RIT also effected RX and TX and split did not function in CW mode). So now CW Tone works fine.

Here is the issue as I see it- and where I would like some help as I may be missing something.
In order for the digital dial to read the correct CW frequency on RX, you have to set the CWBFO= IF OFFSET. This works. The result of doing this though, places the RX CW signal in the center of the xtal filter passband. This then means you will hear both sides of zero beat of incoming stations and you have to remember which side of zero beat to tune to in order to work a station. Does someone see a work around for this? Not a huge deal, but I would have no clue how to explain it to the designers.

And finally, many thanks to Ed who has really been pushing the gang in China to get new firmware changes accomplished.

Subject: [X1M_QRP-Transceiver] Firmware Update

The latest firmware update has been added to the Files Section.

This update changes the step of the RIT control and hopefully improves the CW operations.

This update is only for the X1M-Pro model. It will also work on the X1M models that have had their front panel upgraded.

Other than hearing both sides of zero beat, the rig is fine. All of the other CW issues have been solved. This one could be fixed also if we can figure out how to communicate this to China. I am enjoying the rig immensely now.

There are two pretty basic ways to tell as of right now , at least prior to the new shipment coming in .

What color and shape are the buttons on the front of the radio .

What color are the circuit boards inside of the radio . There is one more possibility but lets see what your answers are to this first .

Thank you, Charlie - I see a VFO A and B but see where split operation is only possible in SSB...is that correct?
I see no receive filter selection but have a NEScaf filter so that should take care of that.
Anyone used the X1M in a contest and have any "observations..especially with being swamped by loud stations close by?

Hi Charlie

I regret to say that I haven't been on HF from my home QTH for about 3 years now. Big winds one spring took out both trees that held up the ends of my G5RV and threre aren't any others close enough to allow me to string it up again. I have a small tower to go put up but it is one of those tasks that always seems to be bumped lower on the "to do" list.

I'm currently away from home in VK1, trying to get our old house up here ready for sale. No radio gear with me at ll this trip.

I have never tried 17 Meters but who knows, once I get a X1M, I will give it a try. Meanwhile I'll look up the Omniangle.

Hi James ,

I will have to check but I am pretty sure we had that issue fixed where split is operational in CW also .

I use the Xiegu filter that Ed sells but it appears to be a close copy of the NESCAF filter .

I did listen a bit during the sweepstakes , but I had not yet installed my AGC . It was "possible" to operate , but I won't say pleasant . However after 48 years of contests I could have got by with it . I really need to spend more time on CW with mine now . This last firmware update resolved a couple of CW issues that we had experienced by fast operators under certain conditions . Many of the updates have been CW related , and although I haven't loaded the new firmware yet , Dale (W4OP) tried it yesterday and said that the issues had been addressed and now worked properly .The last update was just released yesterday .

We still have a technical discussion going on about having the CW signal centered in the pass band. If you haven't seen the messages from yesterday I would say a CW operator and contester should read them and feel free to express your opinion . It is very difficult to write the needed change simple enough that the Chinese factory truly does understand it . They are VERY good about making the changes , but they understand almost no English so it has to be in very simple form . I think of drawing stick figures .<grin>

Have you thought of sending the schematic to a poster company. You know the ones that will make a poster from any photo you have.

Hi there!

Electro Sonic in Canada has the same speaker in stock.
Price is 4.73.

http://www.e-sonic.com/acc/products.aspx?partID=AS05008MR-4-R&partIDExt=339&command=detail
http://www.e-sonic.com/acc/products.aspx?partID=AS05008MR-4-R&partIDExt=339&command=detail

Minimum order is 25 dollars. I've sent an email to see if I could buy
directly but no response so far.

Hello group.

I've posted two pictures of the AGC board that I assembled and a picture showing the size of the surface mount resistors.

The board was quite easy to assemble - but I did have to wear two sets of reading glasses in order to see the parts! Took about a half-hour.

A very big thanks to Dale W4OP for designing and making this kit available. I've got a x1m on order and this will be the first mod I'll make to the radio.

I too have assembled my AGC board and I am waiting for the radio to arrive. Today in the mail I received two RD16HH1 16 watt mosfet transistors. So I now have two mods to install, the AGC and the final swap. I also would like to incorporate a speech compression circuit INSIDE the radio but I need to explore that option after the radio gets here.
Fun days ahead!!!!!

2514. Speech processor

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-22 20:58:57 UTC
From: Bastress, David G
Topic: 2514 Message: 2514

To: Lee N9LO,

Hey Lee I was looking through your info on the speech processor for the X1M and I noticed that the SSM2167 in your project was mounted on some kind of a header or carrier board. Where can you get those at a reasonable price? The SSM2167 by itself is only a couple of bucks but when you look at the price of one of the proto boards the company sells it is enough to make you faint!

I would like to find a source for a couple of those boards at a reasonable price. I have a couple of other chips of that size I would like to play with as well as make a speech processor for my X1M when it arrives.

Thanks.

Dave K3GAU

I guess the answer is yes and no... I can adjust the output level in digital modes by varying the audio drive level into the mic input. Also there is a mic gain trimpot inside the case that can increase or decrease the amplitude of the TX response to an input. But I know of no way to limit the max TX output in a manner analogous to my Icom, where I can adjust the percent of maximum TX power I am allowing. I'm afraid this is a poorly worded reply...

Not at all. I just wanted to make sure that I wasn't missing something.
As far as digital, aren't you just adjusting the interface (ie signalink)?

I have calculated that the output should improve to 9 watts or so, based on the additional 3db gain of the Rd16HHF1 mosfet, assuming the radio is already outputting 4.5 watts. Murphy's law says I will be wrong. We shall see.

Hello
group.

I've posted two pictures of the AGC board

that I
assembled and a picture showing the size of the

surface mount
resistors.

The board was quite easy to assemble - but I
did

have to wear two sets of reading glasses in order to
see
the

parts! Took about a half-hour.

A very big
thanks to Dale W4OP for designing and

making this kit available.
 I've got a x1m on
order

and this will be the first mod I'll
make to the

radio.

Pete

As a circuit designer for a number of years, I would advice that you not expect too much from your modification. Such amplifier designs are usually structured so that the overall gain is more dependent of the values of the passive devices, like capacitors, inductor, and resister, rather than the parameters of the active devices. Active device parameters have much greater variability from device to device, which would make circuit behaviors much more variable - not a desirable characteristic.

So, I suspect that you will not see much of a change when you install the "higher gain" device.

You guys should change the subject line of this thread (re: output transistors). When I first started reading this post, I thought the comments were about the AGC circuit mod. There should not be any comments that would lead anyone to think the AGC mod is anything other than a great improvement.

Just my 2c.....

---In X1M_QRP-Transceiver@yahoogroups.com, <wkpres@...> wrote:

As a circuit designer for a number of years, I would advice that you not expect too much from your modification. Such amplifier designs are usually structured so that the overall gain is more dependent of the values of the passive devices, like capacitors, inductor, and resister, rather than the parameters of the active devices. Active device parameters have much greater variability from device to device, which would make circuit behaviors much more variable - not a desirable characteristic.

So, I suspect that you will not see much of a change when you install the "higher gain" device.

Hi Victor, I have not had time to do a lot with the X1M post firmware update but did make a CW QSO using the internal keyer. I did not notice anything different, but that is admittedly a limited experience. The station I was working did not bring any issues to my attention. I did not have any reason to observe timing or spacing on the scope.
Can you be more specific about what has gotten worse.

Dale W4OP

Hi friends. Today, updated firmware. Something becomes better, but
internal keyer works very bad. First dot and RIT step is ok.

Hi Victor , I am also interested in your issue , I have not yet operated CW with the upgrade .But will duplicate your working conditions and give it a try along with Dale.

I was going to e-mail you last night anyway . I checked the postal service here yesterday and Mouser was pretty close on cost . For me to send you a 1 pound package non priority is $16.50 shipping .

It has to be available somewhere else where the shipping is much more reasonable .

Charlie , W5COV

You are correct Ed , I was a bit confused myself reading the post .

From: Dale Parfitt
Topic: 2525 Message: 2531

I just ran maybe 5 minutes of CW at 20WPM. The only thing I see (and this was there before the latest firmware) is that maybe(?) the keyer has implemented character spacing.
For review (and from memory):
The spacing between dots, dots-dashes or dash-dashes= 1 dot length
Dash= 3 X Dot
Spacing between characters= 3X Dot
Spacing between words= 5X Dot.

My Accukeyer also implements character spacing and keeps me honest. It is difficult to say for sure without some scope sleuthing, but that is the only thing I am seeing that one may not be used to or odd.

Hi Victor, I have not had time to do a lot with the X1M post firmware update but did make a CW QSO using the internal keyer. I did not notice anything different, but that is admittedly a limited experience. The station I was working did not bring any issues to my attention. I did not have any reason to observe timing or spacing on the scope.
Can you be more specific about what has gotten worse.

Hi friends. Today, updated firmware. Something becomes better, but
internal keyer works very bad. First dot and RIT step is ok.

Hi Dale and Charlie. My English is not so rich to explain what is going on. But I will try. Spacing is ok, but when you start transmit after each letter you need wait time before to send next letter, maybe, 5 dots interval. But if you want to transmit faster, you do not need wait this time. Never seen before any electronic keyers cheap and expensive which work this way! Maybe, I want to have 2 dots interval between letters. It looks so, it breaks transmiting. It is possible only in China. They never work CW, and they do not know how it has to be working. Excuse me for my English

That was the dash length that we gave the Chinese group: Dash= 3X dot. I recall looking at that on my scope with the former firmware and they had it right.

Your English is fine Victor. No apology necessary there.
Yes, I think they may have inadvertently added character spacing, but not an issue here. In the end it results in more "machine like" sending, but less personality perhaps. This may be part of Dot memory. Dash memory was very important to have implemented. Dot memory less so.

Hi Dale and Charlie. My English is not so rich to explain what is going on. But I will try. Spacing is ok, but when you start transmit after each letter you need wait time before to send next letter, maybe, 5 dots interval. But if you want to transmit faster, you do not need wait this time. Never seen before any electronic keyers cheap and expensive which work this way! Maybe, I want to have 2 dots interval between letters. It looks so, it breaks transmiting. It is possible only in China. They never work CW, and they do not know how it has to be working. Excuse me for my English

73/72 - Victor, UA1CEX.

☐

I just ran maybe 5 minutes of CW at 20WPM. The only thing I see (and this was there before the latest firmware) is that maybe(?) the keyer has implemented character spacing.
For review (and from memory):
The spacing between dots, dots-dashes or dash-dashes= 1 dot length
Dash= 3 X Dot
Spacing between characters= 3X Dot
Spacing between words= 5X Dot.

My Accukeyer also implements character spacing and keeps me honest. It is difficult to say for sure without some scope sleuthing, but that is the only thing I am seeing that one may not be used to or odd.

Hi Victor , I am also interested in your issue , I have not yet operated CW with the upgrade .But will duplicate your working conditions and give it a try along with Dale.

I was going to e-mail you last night anyway . I checked the postal service here yesterday and Mouser was pretty close on cost . For me to send you a 1 pound package non priority is $16.50 shipping .

It has to be available somewhere else where the shipping is much more reasonable .

Hi Victor, I have not had time to do a lot with the X1M post firmware update but did make a CW QSO using the internal keyer. I did not notice anything different, but that is admittedly a limited experience. The station I was working did not bring any issues to my attention. I did not have any reason to observe timing or spacing on the scope.
Can you be more specific about what has gotten worse.

Dale, yes 1 dash it is 3 dots. That is ok, but it has to be NO limit in interval between letters. Before to send next letter, I have to wait 5 dots interval. Why??? I work CW all my life, but never met keyers work this manner.

Could everyone do those of us reading this in the digest mode a favor? Snip the messages if you have a bunch of excessive quotes that aren't required to understand your reply? It took me a while to even realize it was happening but the really long messages get snipped so I only see some of the emails. Once I realized that I open them in another window to see the whole thing but the 20 pages of empty lines or quotes for 2 pages of actual content of quotes is a horrendous pain. Back in the old days of listservs I think everyone knew to snip but that information has gone by the wayside. Thanks!

Dale, when you get a chance could you describe the graph as you might caption it? I get that the x-axis is frequency in the 80meter band and that each division is 1kHz. There is a peak with approx a 2kHz half height width looking to be between 3 and 5 kHz from the origin. The y axis is in dBm with a -30 dBm reference. Is this the opposite sideband? Thanks!

The center of the X axis is 3700KHz- the frequency the X1M was set to. Everything above the center line is USB and below the center line is LSB- the proper mode for 80M.
I typically get reports of a lack of highs in my audio- and the plot shows a rolloff of highs. I was impressed by the opposite sideband attenuation.

Check to see if the output impedance changes with the new transistor. Many transistors will give higher gain, but only with higher voltage. Think IMR 510. When you change anything in the final amp it should cause a change in output impedance. It's been a long, long time since I took my extra class exam, and I just don't remember the equations. I should look them up. 73

Thanks Dale, I'm an old scientist but a new ham... still learning.

---In X1M_QRP-Transceiver@yahoogroups.com, <parinc1@...> wrote:

☐ The center of the X axis is 3700KHz- the frequency the X1M was set to. Everything above the center line is USB and below the center line is LSB- the proper mode for 80M.
I typically get reports of a lack of highs in my audio- and the plot shows a rolloff of highs. I was impressed by the opposite sideband attenuation.

Dale, when you get a chance could you describe the graph as you might caption it? I get that the x-axis is frequency in the 80meter band and that each division is 1kHz. There is a peak with approx a 2kHz half height width looking to be between 3 and 5 kHz from the origin. The y axis is in dBm with a -30 dBm reference. Is this the opposite sideband? Thanks!

---In X1M_QRP-Transceiver@yahoogroups.com, <parinc1@...> wrote:

I posted a JPEG of the close in spectrum of the X1M on SSB to my Phoro Album. The opposite sideband rejection is excellent. Taken on an Agilent N1996A SA/SNA.

Check to see if the output impedance changes with the new transistor. Many transistors will give higher gain, but only with higher voltage. Think IMR 510. When you change anything in the final amp it should cause a change in output impedance. It's been a long, long time since I took my extra class exam, and I just don't remember the equations. I should look them up. 73

On Sat, Nov 23, 2013 at 9:07 AM, <ed@...> wrote:

You guys should change the subject line of this thread (re: output transistors). When I first started reading this post, I thought the comments were about the AGC circuit mod. There should not be any comments that would lead anyone to think the AGC mod is anything other than a great improvement.

Just my 2c.....

---In X1M_QRP-Transceiver@yahoogroups.com, <wkpres@...> wrote:

As a circuit designer for a number of years, I would advice that you not expect too much from your modification. Such amplifier designs are usually structured so that the overall gain is more dependent of the values of the passive devices, like capacitors, inductor, and resister, rather than the parameters of the active devices. Active device parameters have much greater variability from device to device, which would make circuit behaviors much more variable - not a desirable characteristic.

So, I suspect that you will not see much of a change when you install the "higher gain" device.

Hello
group.

I've posted two pictures of the AGC board

that I
assembled and a picture showing the
size of the

surface mount
resistors.

The board was quite easy to assemble - but I
did

have to wear two sets of reading glasses in order to
see
the

parts! Took about a half-hour.

A very big
thanks to Dale W4OP for designing
and

making this kit available.
I've got a x1m on
order

and this will be the first mod I'll
make to the

radio.

Thanks Ed,

I have just successfully updated to this latest firmware, but I found that I had to lower the port speed to 2400 / 57600 (from the default 2400 / 115200), as the software was freezing (crashing) at around 70% upload to the radio. All of the previous software updates had worked for me at the default 2400 / 115200.

So, all is well but I thought I would share this with the group in case anyone else has the same problem when attempting to update to this latest version.

My experience was it loaded fine with the default values, no need to lower the baud rate.

According to the data sheets, both Mosfets are designed to operate at 12v, same pinout etc.
6 watt: http://www.alldatasheet.com/datasheet-pdf/pdf/132034/MITSUBISHI/RD06HVF1.html

16 watt http://www.alldatasheet.com/datasheet-pdf/pdf/197589/MITSUBISHI/RD16HHF1.html

Only time will tell if this might work. I will use my radio (When it arrives) as the test unit.
Ken

2555. W4OP Scoe for sale

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-25 02:30:47 UTC
From: Dale Parfitt
Topic: 2555 Message: 2555

Hi Guys,

I bought a digital scope some time back when I began investigating the CW Keyer issues on the X1M.

Anyway, I have Kenwood 150MHz 4 channel scope with probe for sale.
Here's the only downside- the CH 1 vertical amp is non-functioning. The other three channels work fine. The scope has on screen readout of voltage step and sweep time. I can take a photo of anyone is interested. Model is a CS-6020.
No manual- but it is a standard scope- no surprises. $95 includes UPS shipping.
I see there is a service manual currently on eBay, but one should be able to just compare B channel voltages to A channel voltages and locate the bad part if you want all 4 channels working.
Tnx,

Dale W4OP

Great Lee,
I was hoping someone in the group would get it.
I'll get her boxed up- may have a second probe too - and ready to ship when you give me the word.

If you can send a check, that would be great as I end up paying income tax on my PayPal account.

Dale Parfitt
P O BOX 645

Thanks Dale, I'll put the check in the mail tomorrow. My shipping address is on the check and in the attached note. I was looking for a better scope to upgrade my analytically instruments. This is perfect timing. You can send it when you return from your Tday week travels. I appreciate what I perceive as a great deal!

Thanks and safe travels,

Lee

Dale,
The most reliable source for the 6 watt mosfet is RF parts @ $4.25 each.
The 16 watt mosfets are super fast from http://www.kitsandparts.com/parts.php They got them to me in 2 days, two for 10 bucks plus shipping.

Hello all,

A while back, Charlie requested postings from anyone with ideas for using the X1M. I had an hour or so spare today so threw together a quick video of my project designed to allow me to quickly and easily switch the operation of my X1M from the shack to portable use.

Hopefully you can get the gist of it from the following link.

Subject: [X1M_QRP-Transceiver] X1M for fixed or portable use

Hello all,

A while back, Charlie requested postings from anyone with ideas for using the X1M. I had an hour or so spare today so threw together a quick video of my project designed to allow me to quickly and easily switch the operation of my X1M from the shack to portable use.

Hopefully you can get the gist of it from the following link.

We are really getting off topic, but...

MANY years ago -- likely the early 1930s, before I was born (really!), my parents rented a small house in the suburbs of Niagara Falls (where I was born). Police officer comes to the door -- not sure what he was there for -- some disturbance in the neighborhood. Amos and Andy were on the radio, which was playing in the background. Police officer asks to come in -- stays through the show to listen with my parents, then goes on his way.

Beats donuts...

I ordered 5 of the stock devices (to meet minimum) to
fix a friends X1M. I hope I'll never need all five, so
if anyone wants to stock a spare, let me know.
On a break this afternoon I have been working all
over Europe on 40M CW with the X1M. Still getting a kick out
of what the rig can do.

Being from down under I forgot. Happy Thanksgiving to you all.something we don't have here.

I always wish an ex work colleague Happy Independence day.she's been working in Aus now for over 10 years and says I'm the only one she gets a "happy 4th" from.

When I got my test I realised all was well in the world of electrons, so I hope everyone had a great and safe Thanksgiving.

From: ken fest
Topic: 2583 Message: 2584

Since we are fooling with schematics, maybe someone can look at page 7 of the schematic, the RF amplifier chain.
It appears to consist of three active devices. The first device is a UPC1678G amp chip. It is preceded by a 3db attenuator. I am guessing the previous stage is too hot and needs reduction to maintain linearity of this gain block. After the UPC1678G I see a .1db attenuator. I am guessing this is there to insure stability.
The next active device is a RD01MUS1 mosfet whose output is coupled to the final mosfet, RD06HVF1.
I wonder if some type of addition could be made anywhere in this amplifier chain to allow variable RF output power from an added pot on the rear panel. I have done similar things with bipolar transistors but I have not done it with mosfets. I have looked at mini circuits SMD variable attenuators but their insertion loss seems too high. Something reducing the 13V feed to the final might work and might also really upset that stage.
Has anyone attempted something like this in the past? I just think it would be a nice addition to be able to reduce the power output when desired.
Thanks for any help and suggestions.

G'day Dale,

While all you "northerners" have been relaxing with thanksgiving, I've been sweating it out over a hot (well warm anyway) soldering iron. assembling my very first SMD project.your AGC board.

Boy! those components are small when you have not done anything with them before.

I think everything went OK...all was smooth sailing until I couldn't find the 1M resistor labelled 1004.I did have a 105, and that sounded familiar, and a quick check with Dr Google revealed 105 and 1004 are both labels for 1M SMD resistors so all was OK.

Close examination under good light and high magnification reveals a board with components that look OK, with all joints appearing to be soldered correctly and no short circuits, however, as I'm about to head off for 2 weeks, and taking my X1M with me, I'm not feeling brave enough to mount the board in the radio.just in case.

I'll wait until I get back then I'll tackle that.

I just wanted to say thank you for your efforts in designing and supplying the kits and to let you know I really appreciate your efforts and for giving me the opportunity to learn something else new today.the world of DIY SMD.

Date: 2013-12-01 23:25:18 UTC
From: <pezcat19@...>
Topic: 2591 Message: 2591

Hello all,

When I was installing my AGC board, I managed to bump the small pot (trimmer) next to pin 5 of the MC1350.

Can anyone tell me what this pot (trimmer) does? I know it moved, and I "think" I have placed it back to where I it was originally, however if anyone can shed any light on what this pot does would be great.

Cheers,

Perrin VK3XPT

I just noticed we have a schematic in the files section... :)

Is that pot (trimmer) for setting the fixed AGC voltage on pin 5 of the MC1350? If so, then I suppose that now with the ACG mod installed, this pot does nothing??? (And I dont have to worry about the setting of this pot any more?)

If anyone can confirm or deny my theory, it wold be great!

Thanks again,

Perrin VK3XPT

Hi Perrin,
I assume you are referring to the pot that is on the X1M board? If so, then that is correct- it is no longer used. At least one builder removed it instead of lifting pin 5 on the MC1350.
Did you resolve your low audio issue?

Dale

Thanks Dale!

That answers my question - thanks for your help! :)

The low audio issue still exists for me. The problem might be that I am used to an FT817, which has HEAPS of audio gain. I am not sure if my X1M is on the quiet side, or if it is normal with these rigs. For example, I did the MDS tests and found the same (excellent) results as others here. The problem is that is the audio output is SO low that headphones are really needed to hear weak signals. (RX gain seems OK - it seems to hear all the weak signals that my FT2000 does, but with an extremely low audio output)...

Another interesting point, is that a noisy band with s7 to s9 noise on the FT2000, is very quiet on my X1M. If using an antenna such as Mag Loop where you need to tune for maximum RX noise before 'fine tuning' on TX, is almost impossible, as the X1M makes so little noise! (This is a good and bad feature - I guess!)

Perhaps I need to meet up with another X1M owner to do some comparisons... Until then, I still enjoy this little radio and it constantly receives excellent on-air reports :)

Cheers,

Perrin VK3XPT

Hi Perrin,
Did you confirm that the AF mod did indeed yield the expected +12dB of gain?
Now, I use full size antennas and Yagis on all bands so there is lots of signal, but I rarely run my AF Gain control past 12 o'clock or so and only use the preamp on 20M and up.

I am redoing the manual a bit with photos of the AF mod and having builders first confirm that they did the mod correctly before going on to the AGC installation.

Also, try turning the AGC pot down to zero V. My thinking here is that perhaps some 1350's need less voltage to run wide open. My ARK-40 rig (mid 1990 vintage) has its 1350 Pin 5 set at just over 5VDC for no signal. If we did that on the X1M, the radio would be dead quiet except to S9+60dB signals.

Maybe someone can correct me but I don't think 1350's are any longer being made in the U.S. So perhaps some of the specs have changed on overseas manufacturers? If you look at the gain vs AGC voltage on the front page of the AGC manual, you will see that gain reduction in the 1350 does not begin until 5VDC. On the three AGC mods I have done to the X1M, gain reduction begins at about 4.2VDC. Pin 5 is actually a current controlled pin but the voltage translates directly. Something has definitely changed.

All modern rigs have a front end noise figure that is so low that the limiting factor on noise is ALWAYS manmade nosie, galactic noise and atmospheric noise. One can easily prove this by removing the antenna from your rig while listening to an unused frequency on the HF bands. If the nosie does not drop, something is very wrong with the radio. So, the reason your X1M sounds quiet is low system gain, not anything to do with internal noise.
We need to find out why your gain is so low.

Hi Everyone, Checkout the stand that I made for my X1M made from a DVD Case. There is a pic of it in the photo's section (John's Case). Wish that I could take credit for it's design. The credit goes to KR1ST. He build one for his FT817 but it works great for my X1M. Detailed instructions are on his site: http://www.kr1st.com/ft817stand.htm

I used hot glue to make mine very solid but without glue it folds up for mobile operation. Best of all it is easy to build and cheap.

Regards, John KC9YAW AKA Rick.

Very nice presentation Slavador. 17M does indeed look bad. Is it possible to span say only 1 or 2MHz so we can see what is going on close in? Do you think it is possible that the PA is oscillating on 17M? The spikes below 18MHz are suspicious.

I think we all had high aspirations for this RX when it was first announced last year . Many bugs existed- no S meter, no FM etc. It still is I believe deaf on VHF. But the designer has worked out some issues. You will find a discussion of it in the SWL section of eHam forums. For now, I think I would steer clear.

GA Salvador,

While you are looking around 18 MHz. for Dale could you possibly see what
the spectrum looks like around 5.35 MHz which is our 60 meter amateur band?

Thanks.

Mike, if you have an interest in building and experimenting with something pretty similar, there was an article in January 2013 QST on a receiver built from a cheap and readily available on eBay dongle. It also included the plans for an up converter board for the ham bands.

I tossed their up converter over the fence and built a decent one for a friend. He plays with it all of the time and they even have an app to use it as a scanner. He just loves to use it. I have another one here, but SDR is low on my build list right now. Actually I had trouble getting all of the software properly loaded, but that was a problem with me alone, that I often have. My friend is a ham and just retired as a system analyst and had zero problems with it. One day I will get back to it when I have time to see what I am doing wrong with the software.

Do you happen to remember what month Charlie. Thanks for the heads up.
I don't mind doing the soldering and mechanical part of a build. But, I couldn't do it from a schematic. I would need pretty blunt instructions.

Mike it was January 2013 . The VHF/UHF portion requires no soldering to make it work. FAR circuits does sell a board for the upconverter , the quality is not high, but pretty simple. I don't think you would have a problem with it, but if you do just holler at me and I can help you out on any building part. My only problem with this particular project was software only, and that is due to myself completely, with my memory issues from my brain damage, plus not working in the computer and electronics field daily, I am far from current on state of the art, especially computers and software.

Thank you Charlie. What I'm looking for is a lf/mf/hf receiver with SSB as well as AM. Maybe some decent filtering. Your basic SWL receiver with SSB. A kit would be great. But they tend to be too narrow in coverage.
Do you have any suggestions?
Cheap is good too.

Although they are a bit pricey, the Lowe HF-150 is a fabulous RX. The AM sync detection is second only to my K3. Built like a tank. Internal batteries and internal built in whip preamp. I have backlit mine and use it nightly and on all vacations. The Grundig's, Tecsun's etc look like toys compared to the 150. Very simple to operate and great audio.

Mike what myself, and most of the people that operate in the LF/MF range up , use the Icom R-75 . It is a rugged old receiver that has been around for many years and I am not certain, but they may even still be in production.It is what I would call your basic SWL receiver and there are extra mods and filters available if you want to soup it up. It is pretty much found in all of the LF operators shacks that I know, or have known for the past decade.

Used ones show up from time to time on eBay , the R-75 group , Universal Radio and other places. Kiwa is a company that has developed some nice mods for it and some people used to have their new receiver shipped to them for some mods first. Mine is stock, with no filters , but has DSP . I would like to pick up a filter or two someday for my LF work.

From: Dale Parfitt
Topic: 2605 Message: 2619

THat is an excellent recommendation Charlie- I had forgotten about the R-75 even though I owned one a while back.

Mike what myself, and most of the people that operate in the LF/MF range up , use the Icom R-75 . It is a rugged old receiver that has been around for many years and I am not certain, but they may even still be in production.It is what I would call your basic SWL receiver and there are extra mods and filters available if you want to soup it up. It is pretty much found in all of the LF operators shacks that I know, or have known for the past decade.

Used ones show up from time to time on eBay , the R-75 group , Universal Radio and other places. Kiwa is a company that has developed some nice mods for it and some people used to have their new receiver shipped to them for some mods first. Mine is stock, with no filters , but has DSP . I would like to pick up a filter or two someday for my LF work.

Charlie , W5COV

On 12/2/2013 4:45 PM, mikejmardis@... wrote:

Thank you Charlie. What I'm looking for is a lf/mf/hf receiver with SSB as well as AM. Maybe some decent filtering. Your basic SWL receiver with SSB. A kit would be great. But they tend to be too narrow in coverage.
Do you have any suggestions?
Cheap is good too.

2620. General Info

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-03 08:59:10 UTC
From: <john_bell38@...>
Topic: 2620 Message: 2620

Hello
New to this group, just a couple of questions from experienced users. I am waiting for delivery of X1M

1 Is there a power level setting?

2 Tuning appears to be similar to decade swiches (software), if you set the digit to say 100Hz and tune is the tuning continuous, in other words could you tune a ham band without changing digit in steps of 100Hz or whatever digit were chosen?

3 Is the display crisp and easy to read with its small size.(for older chaps)

4 Has anyone used a set of external band pass filters for the Warc bands and used them successfully. One of the members produced some spectrum test results showing spurii very close to the wanted bands which will probably be difficult or not practical to remove. I think it looked as though one warc band was a practical proposition.

Many thanks in advance John

From memory, the last of the front end filters is enabled. It appears to be a 30MHz low pass filter.

Hi John.
Outside the bands there is a filter for RX 30Mhz LPF
Dangerous for images and spurious frequencies at reception.
But receives. Yes! :-))

9MHz with 18MHz IF is hard :-(

IF = 9MHz; BFO = 9MHz, DDS / OL = 27Mhz (9x3)
third harmonic BFO = 27Mhz.
Woooow! that mess!

When I can, I will also look at 65 meters.

Hi Don and anyone else concerned. Thanks for asking that. I had not really done a voltage test under load on that thing and it really needs to be done, so I just did a no-load, 250ma load and 2.5 amp load test on one of those little power supplies I mentioned earlier and the results are in.
Voltage @ 0 load = 13.95
Voltage @ 250ma = 13.80
Voltage @ 2.5 Amps =13.35
I used the KX3 as the load source. No load, KX3 off, 250 ma, KX3 receive @ max volume with LCD backlight on at it's brightest and all extra current hogging options turned on and 2.5 amps was at MAX transmit power (12 watts out into a dummy load).
The supply max current spec is 4.0 amps but I didn't have thing on hand with which to load it that heavy. I do think that .6 volt drop from no load to just over half rated load is very acceptable and as someone else using the same supply said, it's very quiet. I have searched long and hard with the KX3's excellent receiver and have not found any birdies that I can attribute to the supply. I've used one for about a year now and haven't found any reason to leave it home. It was the supply I used at OzarkCon on the KX3. The K3 I had there was, of course, run on my MFJ 4245 MV supply.

2630. Some useful information ?? For operating the X1M on other than the 5 filtered bands.

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-03 23:48:05 UTC
From: Charlie , W5COV
Topic: 2630 Message: 2630

First off the usual disclaimer, no financial interest, etc. etc. Just something to think about if you want a cleaner signal when you want to operate other experimental and ham bands.

Perhaps even an idea for some of our talented group to design as a HIGHLY useful accessory for the X1M. I sketched a couple up on my own before I found these, but I have never mastered PCBexpress well enough to feel confident designing a board and ordering from them and getting the filters designed and offering it as a kit.

IF anyone does do one on their own , I would love to know about it . Contact me off list, if you wish. cvest AT cox.net

http://www.qsl.net/k/k5bcq/Kits/Kits.html (Next to the last item on the page, doesn't appear to be for sale yet)
I normally don't get into amplifiers for QRP , but these guys also offer a 20 watt amplifier at a really cheap price, in my personal opinion. It is about the middle of the page and these guys produce some VERY FINE products !!

http://www.hanssummers.com/ultimatelpf (Also not yet available)

Single band filter kits that are available for sale :
http://www.hanssummers.com/index.php?page=shop.browse&category_id=6&vmcchk=1&option=com_virtuemart&Itemid=265

I own several of these and can HIGHLY recommend them.

Another source of kits or parts to roll your own :

http://kitsandparts.com/rftoolkits.php

The first 3 kits. I have also built and used these and can also recommend them. I buy almost 100% of my toroids from this site.

Hope it helps you get even more enjoyment out of the X1M.

If you have any interesting or useful additions for the X1M , PLEASE share with the rest of us on the group.

Hi All,
I am familiar with those items, amps, and filters. They are one option for us all.
Recently I chose a different path.
I built the 98 cent HF amplifier from the 2009 QST article. It outputs 60 watts using two 98 cent switching mosfets. It is an easy build and really works well.
For filtering, I was going to buy the filter/s you describe, or maybe the switchable filters sold for the Packer amp.
However, instead I watched the Ebay listing and bought a cheap 7 band switchable filter board out of a Kenwood 940S. This board can easily handle 100 watts and works from 160 thru 10 meters.
As a bonus, the board already has everything needed for forward and reflected power indications. Just add a meter and bingo you have a real nice switchable filter and wattmeter for your rig.
I chose to build the bandpass unit in a separate box so that it can be used with any amp I build.
This Kenwood board uses 24 volt relays but that is easily overcome. I have a nifty circuit that uses one switch, one diode, and one cap and can operate any 24 or 28 volt relay from 12 volts.
Just another option for qrp or otherwise.

Hi Ken,

Thanks for sharing that information. I remember reading that QST article. Will have to go back to the archives and have a look at it to refresh my memory.

GREAT idea on the filter board. I have an old Kenwood TS-130SE here that I bought that had no case on it and the final assembly was hanging off of the back. I just bought it for the CW filter in it and offered guys parts from it but had no takers, so now I am kind of glad that I didn't.

I can do a little repurposing of some of the other boards and parts now. I hated to just toss it in the trash, since I bought it so cheap and saved a ton of money by getting the filters out of it , that I sure wouldn't be losing any money. I paid $20 for it.

My filter box is going to be separate also, so I too can use it with other projects.That old rig is now going to prove very useful to me. Glad I am a bit of a hoarder. Thanks again for sharing your projects and ideas !!

I am sure just about everyone on here has similar interesting items they have or could use to enhance the X1M or build some nice station accessories out of. Just have to get them to share with the group.

GA Paul,

Unless they 'drop ship' the X1Ms your dog will probably get a post man or
UPS driver, not an DHL delivery person! :-)

Waiting anxiously just like you!

2645. X1M CW Filter

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-04 22:41:11 UTC
From: Dale Parfitt
Topic: 2645 Message: 2645

Can I get a show of hands of anyone on the list that would have an interest in a crystal CW filter for the X1M? As I envision it, the filter (# of poles to be determined as well as BW) would be automatically enabled when CW mode was selected. The SMD board consisting of the crsytals, SMD caps, drive signal transistor buffer and 2 SMD reed relays would fit on the bottom of the top board. It would require cutting two traces on the current filter (which would still be selected for SSB/digital modes). This is very early on, but if enough interest I'll start on a design. Note: this will NOT be in time for Christmas presents. There are a few challenges involved, so success is not guaranteed.

Dale, you replaced it with the original transistor type, correct? This was a repair, not an upgrade?

Diode steering is certainly a possibility - particularly if the filter in/out Z is reasonably low.

Sure. I would be interested. But I already have the external filter. So it would be dependent on it being a substantial improvement

The CW IF filter would prevent the AGC from reacting to off channel signals- something an audio based filter cannot accomplish. Hopefully, it might also solve the issue that currently exists of hearing both sides of zero beat of all CW stations.

Great Bill. One item I have not added to the manual is to do the Audio mod first and confirm you are getting a lot more audio. Then proceed on to the AGC board.

The Xiegu filter, can also be used with any other radio if you have one Mike. I have a bare bones FT-857D that I have also tried it on. It REALLY helps on that one too. Dale still has the job of building one to fit inside, so that will keep him occupied for a while, when he is just sitting around with nothing to do . <grin> Front panel control and getting away from the Direct Conversion type problem with the X1M and being able to mount it inside, I can personally assure you is MUCH better than ever trying to make the needed changes in the radio, understood by the Chinese.

It REALLY will make a HUGE difference to CW operators, and to people not familiar with DC receiver type CW reception. It will also help those of you that like to listen to QRSS and other narrow band modes, like typically found below 500 kHz.

Don't forget the X1M is a general coverage receiver and there are a LOT of interesting things to listen to below 500 kHz. NAVTEX , Chasing NDB's , Part 5 experimental stations, Part 15 stations, (A Shameless plug for you to listen for my part 15 Lowfer beacon, running QRSS60 , on 185.298.4 kHz. , ID is CV) More information on the Yahoo group I own, part15 (No space between the part and 15)

Yes I did that mod first. Huge difference. Much easier to listen to and now I don't have to max out the gain. I usually run the volume around 11-12 o'clock position. You electronics folks are pretty amazing to me. I wish I would have paid closer attention in math <grin>

2658. Interfacing For Digital Modes?

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-05 04:12:41 UTC
From: rickmac06@frontier.com
Topic: 2658 Message: 2658

Forgive me if this has been covered already. I have spent the better part of the evening searching the forum and googleing without finding an answer.

I would like to use the X1M for PSK31. I was thinking of ordering either the "Easy Digi Interface" or the "SCI-6 PC Sound Card Interface Kit". My problem is that I do not understand how to interface the PTT using software control. I do not think that the DB9 connector has PTT command. There is no VOX on the X1M. Can someone enlighten me "in a dummy langauge, how to interface this radio's PTT for computer PTT?

Thanks and sorry for the dumb question.
Regards, John.

Hi John,

If you look in the photos section , at least one of our members , one of the Lee's, /7 , has a homebuilt interface.

Paul and myself use the SignaLink USB for running digital. Many group members run digital modes all the time with the X1M.

I was not familiar with the interfaces that you mentioned and just took a quick look at what I believe to be the ones you refer to. They do look like they could be made to work with the X1M, but may require a slight bit of modification, maybe a single transistor on at least one of them to use for PTT. Didn't really study them, since I wasn't sure just what one you were talking about, there seem to be a couple with the same name.

Look at Lee's setup and maybe some others will post what they use. If you can't find something suitable , that you can understand don't be afraid that you are asking a stupid question, and we have plenty of people on here that are competent enough to help you get up and running on the digital modes, that also had to start somewhere and learn, thus having to ask people for help. Shoot I still ask questions today, so don't hesitate to ask for help.

I just took my nightly pain meds , after my Dr.'s visit today, so I am about to fall asleep. If you don't get some answers, by tomorrow, I'll have a look and see what we can come up with to get you going.

The only dumb questions are the ones that aren't asked , before stupid mistakes are made.

Dale, you replaced it with the original transistor type, correct? This was a repair, not an upgrade?

I did not realise just how small this radio is until you see it resting on a DVD case.
A great idea, thanks for sharing Rick.
Can't wait to get mine to replace the 6kg FT-707 I have been trying to use portable.

From: Paul W. Ross
Topic: 2658 Message: 2665

The RS-232 connection on the back of the X1M is *ONLY* to control internal X1M modes, frequency, etc. There is NOT PTT on that connection, as you suspect. I use HRD/DM780, just because I am familiar with it and have it. Other packages work as well, but HRD provides a lot of functionality.

PTT (and audio input) has to be done through the microphone connector on the front. I like the SignaLink USB, as

1. It works reliably.

2. it is easy to set up.

My X1M came shipped with a spare 3.5 mm stereo plug, so I used that to cobble up an interface (1/2 of a Ethernet cable), and used a male-male 3.5 mm stereo jumper to get the audio from the back of the X1M to the SignaLink. Plugs and cables are available at Radio Shack, of course.

I believe we put a discussion of that issue in the "User's Guide" -- to be updated when we/I get the new radios, likely sometime next week. The User's Guide also addresses software concerns.

If you can't find the User's Guide in the files section of this group, e-mail me off-list, and I'll send you a PDF file (reflects older RS-232 interface). Christmas project is to bring it up-to-date, of course.

Interfaces -- both commercial and home-built do the following:

1. Isolate audio FROM the sound card to the microphone input -- allowing level setting.

2. Isolate audio TO the sound card and allow level setting.

3. Handle PTT by providing a ground or relay to key the transmitter. The SignaLink lets you set "hang time," which is important for modes like Feld Hell -- Hesschreiber, which are "keying" modes with a fair amount of space between characters, and the transmitter can switch from TX to RX.

The nice thing about the SignaLink (not familiar with the others) is that the SignaLink contains its own sound card and PTT circuit, relays, isolation transformer, etc., etc. All you have to do is set up the internal jumpers and attach the cables. It took more time to find my Allen wrench for the case and tweezers than to set the jumpers! The unit is compact, and is nice for field use with a computer such as a net book.

I "share" a SignaLink between my X1M and an Alinco DX-SR8 transceiver. Thus, my SignaLink to radio connection is the "Alinco standard" for me, thus not requiring that I re-do the jumpers on the SignaLink when I

switch radios -- just pick the proper microphone cable. The Alinco uses an 8-pin plug, and the X1M the 3.5 mm stereo plug, so there is not potential for confusion. Audio output on both radios is from the headphone jack.

Frankly, for the price -- less than $100 -- for the SignaLink, I would be hard pressed to get the parts together for a home-built interface. The SignaLink will interface to most any SSB transceiver and of course, those that do have a digital input like the Yaesu FT-817ND.

Hi John,

I built a digital interface for the X1M using the plans and circuit described on this web page http://www.g4ilo.com/usblink.html http://www.g4ilo.com/usblink.html . I made a few small modifications, mostly just an added potentiometer to attenuate the RX audio from the X1M before it is fed into the computer. I have used it frequently on WSPR and occasionally on PSK-31 with good results. The circuit is based on a USB sound card "dongle" that is readily available on ebay or Amazon http://www.amazon.com/HDE-Channel-External-Sound-Adapter/dp/B0027EMHM6/ref=sr_1_9?ie=UTF8&qid=1386257581&sr=8-9&keywords=USB+sound+card http://www.amazon.com/HDE-Channel-External-Sound-Adapter/dp/B0027EMHM6/ref=sr_1_9?ie=UTF8&qid=1386257581&sr=8-9&keywords=USB+sound+card $2.60 with free shipping... If you decide to go this way, I can provide additional information on the modifications and a few suggestions.

Perhaps someone was doing updates at the time, or Yahoo sometimes does at times these days to be "out to lunch" on their groups and associated mail. I have seen message latency as much as 24 hours . Reminds me of another famous web site. <grin>

Yes I was so tired last night when I responded to the digital question, that I forgot to also add that the DB-9 plug is pretty much completely reserved, for factory or extremely experienced users.

Hi Tim,

Now that would be a story that I would love to hear . Did you receive any documentation at all on your kit ?

Now I don't know all of the members on this group, but I am familiar with a great number of them. However I am not aware of anyone that has built the kit.

It is pretty difficult to even get schematics , let alone board and mechanical, plus assembly documents.

I personally have never even seen a schematic for the kit, so I don't even know if it matches the original assembled model of the X1M.

I know the guys on here will do their best to help you , including myself, but frankly I don't even know where to start and I have even taken an X1M pretty much all apart, including removing parts to take measurements, count windings on toroids , make addition and mods.

Perhaps telling us EXACTLY what you DO have , will allow us to give you a better answer.

Some of us belong to other China radio groups, they might know more than I do, since I have only belonged to the other groups for a couple of months.

John,

I posted some more photos with greater detail and a schematic including the mods. This, plus the info from http://www.g4ilo.com/usblink.html http://www.g4ilo.com/usblink.html , should be all you need. As you can see, my enclosure was designed to work with my Toshiba netbook. I am running digipan (PSK-31) and WSPR using the simple setup in the first picture. As you can see, the interface plugs into the computer via a USB port. The TX line from the interface goes into the X1M's front panel mic input, and the RX cable into the back panel's headphones output. The X1M is not modified in any way for this digital interface.

I also run HRD version 5.24.0.38 (including DM780) using an additional interface cable for rig control. The little netbook handles all this well, although the screen is a bit small. This is a fairly portable setup.

Let me know if you have further questions.

Lee

Hey Charlie,

Thanks for the reply (and all the work that you've done)!!

It's pretty simple, now that I've gotten into it. there's only certain places things can go.

Documents? only a single chinese written paper. (but my buddy who I got it from has some additional documentation)

I believe that the original schematics are identical to this radio.. will see. Have to stuff a few parts (including the LM386), but don't <think> it will be a big deal.

Got all of the 'obvious' parts in.. there are a couple of coax jumpers that I need to make.

Also came with SO-239... but my PL-259 wouldn't screw on very far!! (as if I'm surprised). Found a 'real' one in the connectors box, so I'll use that one.

I got Dale's AGC kit, so will put it to use once I get the box running correctly.

It did come with a couple of flat sheets of copper with notches cut out - looks like some shields. Apparently, one goes over the bandpass filters, and the other over the final. (at least that's about the only places that the dimensions line up)!

Thanks & will keep you posted.

I have the SCI-6 and use it for Mars with fldigi. The whole set up will go through your mic. and head phones. The SCI-6 uses an opto isolator for the PTT. You come off your head phone jack of the radio to the mic. input of your computer through the SCI-6. You come off the head phone jack of the computer to the SCI-6 then to the mic. input of the radio. You use the USB from the computer to the PTT on the SCI-6 that goes to the mic. plug. I did it a bit different. I use a manual PTT switch that I added to my mic. to computer switch box so I could go back and forth during my Mars nets. I have three or four digital programs running at once, Olivia, MT63, M110A , ect. By using a manual PTT switch I don't have to worry about the different programs fighting over who controls the USB.

Hi Lee,

Like I really need another project :) Do you have a specific link or model number to the modem that you used ?

I often build up "spares" of projects, so in case I run into someone that needs one and for one reason or another can't build it , then I have one to send to them.

I just happened to have a SignaLink USB, that I bought when they first came out,that had previously been used with my FT-857 .

If you have any spare warm weather I sure could use a delivery of that. We are about frozen in, with lots of ice and snow on the way. The temperatures are supposed to drop down around zero to a little below, through the weekend. So besides the 160 meter contest this weekend, I plan on finishing up a few projects and starting a couple of more, so I can see what parts that I need to order. (Sure could use Arizona on 160 , if you get on for the contest :)

I hope EVERYBODY gets on 160 for the weekend. I REALLY need about every state and county in the entire USA, since I reset my logbook to zero earlier this year . Looking forward to working ALL of the current X1M owners possible on EVERY BAND & MODE POSSIBLE !! I am also THRILLED to see we are getting an influx of new X1M owners. More people to work !!

With all of the new radios just in time for Christmas , perhaps we should set up some special nets or operating events for ALL of the X1M users ALL OVER THE WORLD , starting January 1, 2014. Maybe someone can organize a net, contest, or some kind of awards just for the X1M community. First WAS, WAC, DXCC, we need a person to set up and coordinate some events for X1M users to collect some special pieces of paper.

Maybe keep track of EVERY contact you make with the X1M in 2014 and total the different categories up at the end of the year and see what the numbers look like. Maybe even have a few certificates printed out for different categories for contact made with the X1M ONLY !!

OKAY HEY I STILL LOVE THIS LITTLE RADIO AND STAY EXCITED ABOUT IT !!!!

Keep us informed Tim. Yeah the original SO-239 had metric threads on them. Yes I have had both of those shields off . If you need us to verify anything I can check it against the early X1M actual board, if they are the same, like you think.

Charlie,

I bought a couple of these http://www.amazon.com/gp/product/B007HISGRW/ref=oh_details_o09_s00_i00?ie=UTF8&psc=1 http://www.amazon.com/gp/product/B007HISGRW/ref=oh_details_o09_s00_i00?ie=UTF8&psc=1 took a while to get here from China, but the price was right and free shipping. If you search Amazon for "USB sound card" you will see a lot that look like the one in the original g4ilo post http://www.g4ilo.com/usblink.html http://www.g4ilo.com/usblink.html . I've built 2 of the interfaces with slightly different versions of that USB dongle and they all have worked well. The one on the g4ilo page and the ones I used all say "7.1 channel sound" or something like that at the top... so I would stick with that subset. I would be surprised if the whole interface cost more than $5 in parts. It might be nice to externalize the TX and RX attenuation pots, like on the signalink device (I have one too and they are great), but once you get them set right, the computer volume controls are adequate.

You keep having great ideas about the X1M. I admire your ambition but I'm a bit lazy... I learned a while ago, ideas are easy, implementation is hard ;-)

QRPkits sells a SOTA tuner for about $30 - it's a very basic device intended only to match an end fed half wave but it's very compact.
I wanted something a little more general-purpose so I built a little L-network tuner into an Altoids tin. The parts cost was somewhere in the $10-$20 range and it only took a couple of evenings. If you want to see it, take a look at http://www.qsl.net/ko4xl/altunah.html
http://www.qsl.net/ko4xl/altunah.html

I have performed the upgrade. Takes just a very few minutes. Make sure you upgrade to the latest version of firmware when you make the change. It is like an entirely new radio and you will be VERY pleased with the night and day difference in the radio.

The audio update is also a great addition and if you want it to be as current as possible, like almost everyone else is doing, the AGC kit and mod make it a radio that can compete EASILY with radios or kits costing twice as much.

Still people experimenting with internal add on boards , that will make it an absolutely unbelievable rig. There IS NO COMPETITION AT ALL IN ITS CLASS NOW !!

Then if you want to build another internal mod inside of the microphone, you can even add speech processing!!

You will also enjoy the added full ham band coverage on the 5 filtered bands, that you have had to do without, up until now.

GM Bruce,

Looked at your tuner on your website. Didn't see any component values mentioned for the inductors you used or a schematic for that matter. I can deduce the schematic from our description but not the inductor values. :-)

Hello

2 problems with X1M Platinum, version number is V3.01b

1. Receives fine, problem is transmit, ssb and cw have a raspy sound to them this makes the recovered audio unpleasant and difficult to understand when monitoring on another receiver. A fellow local amateur also monitored and commented the same.

2. Power is in spec (min 4.5W) except for the first 150kHz of the 10m band where the power drops to 2W. I could understand this if the spec sheet did not state power equal to or greater than 4.5W.

Any help would be appreciated as I do not want to return the product unless I have to, I like it.

Regards John M0GFN

I would put a known 50 Ohm termination on the X1M through a coaxial Tee- place a small wire on the unused Tee port so that you can pick up the signal on your receiver, Make sure you are on one of the non WARC bands. What is your power supply? Is it shielded so RF is not an issue and is it capable of supplying the necessary TX current?

Hi Dale

Done all of that, tried it on 3 different power supplies(including heavy duty) and also battery. Tried it with ferrite clamp chokes on power lead and / or mic lead/keying lead. Only using radio on non-warc bands only.
Additionally the receiver (monitor) is detecting some carrier, this could be just due the proximity of the transmitter or a problem with the X1M.
I wondered if there was anything I could change in the menu but the receive section of the X1M is spot on so the set must be setup fine.

Will have a look with the scope this evening to see if the output looks ok.

Thanks John

Have a listen on 9MHz as you loosely couple to U5C. This is where the Audio chain gets mixed with 9MHz. See what that sounds like. The 9MHz (from memory) is generated by one of two DDS IC's on the top board and gets cleaned up by a 2 pole crystal filter at 9MHz. The exact frequency of the DDS is dependent on menu settings for LSB/USB/CWYou might want to count that DDS BFO during TX also.

From: Charlie , W5COV
Topic: 2698 Message: 2698

This weekend is the perfect weekend to add to pretty much ANY of your counts on 160 , if you collect paper or just keep track for self satisfaction .

Also a good weekend for any of you that have never operated 160 meters before to take the X1M for a "test drive" at least listening to this band. (LSB)

You may just discover the thrill, excitement, and attraction to MF and LF . listening and talking .I am addicted to these frequencies :)

You might just want to build yourself a filter to get on 160 , which by the way is quite a popular QRP band in the Winter.

You will find a whole new world of interesting stations to listen to down below the Broadcast Band also. From experimental ham type operators, to military, airport NDB's, NAVTEX, Part 15 Experimental Beacons,Foreign Broadcast Stations, running almost every mode that you can imagine too.

If you are down in the zero and below temperature areas, with snow , ice , etc. then those are the perfect conditions for these frequencies. They are primarily Winter time bands.

Get a hot cup of coffee, throw another log on the fire, and sit back and enjoy radio on the frequencies that were used by the old time hams and for ships the world over. An excellent experience if you have never tried it.

Charlie , W5COV

2699. Firmware versions/differences/applicable radio versions, etc

From: tim
Topic: 2698 Message: 2699

Hi Folks,

I just got my 'kit' version on the air, and it seems to be doing well. (original Blue boards, had to stuff a few parts, etc).

The thing that jumps out at me right now is the difference in the way the upper portion of 80 & 40 sound (no filtering issue & 9mhz blow-by).

Anyway, these two bands can be 'fixed' by moving the band edges up to the full 4.00 /7.3mHz stops.

I seem to remember some chatter on the group about this way back when, but since I didn't have a radio, I didn't pay much attention.

I looked in the files area, but did not see any documentation as to what version software was shipped with what radio, what versions are applicable for which hardware, etc.

I know that the new platinum firmware probably won't function properly in my early revision board. (although I plan on getting a new front panel).

Is there a firmware version that makes these mods (and possibly more) that would be applicable to my box?

Thanks all!

Tim W5FN

Hi Tim ,

Although I have never tried it , I don't think any of the software will work with this radio , without the front panel , due to the difference in button functions and their configurations , as well as the display change.

As far as I am aware, the factory only supplied the one version of software/firmware that was shipped with the radio from the factory.

I have never seen an update for the original X1M, only for the PRO (AKA Platinum) models.

Hi Dale. Today, I installed AGC. Everything works fine.
Thank you!
Victor, UA1CEX.

Yes Lee, that is what I am using for the antenna and conditions have been very good so far. Guys might want to build up a 160 meter filter for the X1M , since the season is just now starting to get good and there are more contests coming up. They have to cram as much 160 meter operation in to the Winter months as they possibly can and it really is a fun band to operate.

I have the QRP model of the FT-707S, but unfortunately it doesn't cover 160 , so maybe someone will come up with a transverter for it . That rig has been my primary QRP rig for many years and I love it, but most seem to have been sold across the pond, so I keep my fingers crossed that nothing goes wrong with it that is a part that I can't get my hands on. It stays in the radio room, while the X1M is so convenient size wise it stays at my desktop computer location. Would like to find some accessories for the FT-707 , or a non working "spare" QRP model , to have on hand "just in case."

Have fun and work some 160 !!! MANY of you will likely get 'hooked" on MF/LF.

Now an old timers rule of thumb for the LF bands especially. The prime operating months for these frequencies are the only the ones that have the letter "R" in their spelling . How is that for a bit of trivia ?? LOL

2710. Quality Surplus Parts For Builders (OT) ?

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-08 03:36:53 UTC
From: Charlie , W5COV
Topic: 2710 Message: 2710

Even though the X1M is an excellent plug and play radio right out of the box , the ham / experimenter is also attracted to it because of its versatility to adapt to other projects as well.

Charles Wenzel , a VERY well known engineer world wide, also has hobbyist electronics as his hobby. You can check out all kinds of cheap and easy circuits and devices to build on his hobby page : www.techlib.com , be certain to check out the circuits tab at the top. for even more projects.

He owns two super high tech electronics manufacturing companies and has now opened an outlet on eBay to dispose of used/tested items that have been returned for refurb and upgrades, plus new parts that are now no longer used in his current production products. These are top of the line parts .

You can check out his line of production products if you want to see the class of the parts required at:

www.wenzel.com , or his other company , www.crovencrystals.com

Be sure and add him to your favorite sellers list. His surplus parts are listed under seller name wenzelassociates

I use as many of his parts and products in my home building projects as possible. I have 2 of his 10MHz. OCXO's to lock my test gear to and to also lock my DDS-VFO's to for perfect frequency accuracy on all of my beacons. I have roughly 6 beacons , that I can configure to operate different digital modes from nearly DC through 30 MHz.

I also will be locking my 6 meter and 600 meter transverter for the X1M with these OCXO's and also be able to use an Adafruit GPS that outputs a 1 pps signal.

So if you are looking for parts have a look. **AGAIN NO FINANCIAL INTEREST, JUST A VERY SATISFIED CUSTOMER**

2714. low pass filters

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-09 02:26:48 UTC
From: <lphebus@...>
Topic: 2714 Message: 2714

Hi, any suggestions on low pass filters I could purchase for use on the X1M output for the ham bands the X1M does not "officially" cover? For example, I would like to use WSPR on 30 meters, but probably should add an appropriate LPF between the transceiver and antenna (correct?). Kitsandparts,com (http://www.kitsandparts.com/ http://www.kitsandparts.com/) has a series of kits available and this would be my first choice. But to complicate matters, they have a number of different choices and I am uncertain which is "best".. Also Hans Summers (http://www.hanssummers.com/lpfkit.html http://www.hanssummers.com/lpfkit.html) has LPF kits that I have seen discussed on this site. I assume I need a separate filter for each of the ham bands (2, 30, 17 and 12 m) not covered by the X1M's specified "official" bands (80, 40, 20, 15 and 10 m)... correct? Sorry to appear ignorant, but sometimes the truth shines through ;-) Any suggestions, the more specific the better, would be appreciated.

Thanks -Lee

Hi X1M Gang,
If you guys don't need filters pronto, maybe we can come up with a filter kit just for the X1M (I promise, not surface mount). Say, a board that has space for 4-5 filters, and you can populate it with whatever bands you want. The board would have relay switching on the board so you only have to switch +12VDC to the appropriate band relay- done by a small rotary switch. The only questionable band might be 17M based on the SA plots supplied recently by one of our members.
Right now, I am characterizing 100 9MHz crystals for our other project.

Hi Guys,

Both of those sources are very reliable sources and either one would be a good choice. Yes it requires one filter for every band that you want to operate on.

My own personal opinion, and I do business REGULARLY with both of these companies, is that in this case, that unless you only want to add one band to your X1M , then Hans is the most sensible choice, as soon as his newest product is available.

He is currently working on a 5 band board, which should be in production any day now. It also has plug in filters so you could even have more bands if you didn't mind having a box of loose filters to swap out with one on the board .
http://www.hanssummers.com/shop.html?page=shop.product_details&flypage=flypage.tpl&product_id=49&category_id=6

The price is VERY reasonable in my opinion.

Hans also offers filters down to 2200 meters , 600 meters , etc. I built a 1750 meter one too.

What I would REALLY prefer , is a couple or more of guys here on the group , to put their talents together and design a board and filters and maybe a few other accessories for the X1M. I am not computer literate enough to draw up the boards and create a web site, that would contain even more help and information for X1M users.

If I remember correctly it would take 10 additional filters, to cover all of the WARC bands and ALL of the experimental bands .

The accessories "could" be used for other radios, but it would also be nice to see what this extremely talented group of users and designers,software,hardware, and other builders,tinkerers and designers, could come up with and know that the items would positively work with the X1M.

Starting tomorrow, sounds like we should start seeing more and more of an influx of X1M owners daily. THAT is what thrills me !!! Would love to see them immediately sell out and get ready for yet another hopefully even larger production run !!

GE Dale,

I would be interested in a filter board. I might be interested in the xtal filter for cw but I would like to get my X1M first and see what I think of it as it comes from the factory.

Dale,

I was looking at the spectrum of my 'kit' version out of bands, and it is utterly terrible. not just multiples of the fundamental, but a lot of trash.

I further looked, and there are actually 6 bandpass filters, not 5, as the 5 are for the 'normal' bands that it covers.

It kind of looks like (and I haven't investigated this fully), that the 6th filter may be what is in there for the non-ham bands (or WARC). It passes everything.

So, at least with the version I have (just looking at the schematics), I'm not sure just a low pass filter on the output will really help a whole lot.

I'll have a look at the 6th filter & see what it does, and when it's energized... have to look on the output of that hc238 decoder to see.

Just thought I'd give a heads up. (hoping that I am totally wrong).

So, as I understand your (very helpful) post, outside of the bands "supported" by the X1M, the transmit signal is very noisy and a simple LPF probably will not be enough to clean the TX adequately for interference-free use. I suspect that this means a band pass filter? Or perhaps something more complicated? My spectrum analyzer tops out at 12 MHz, but I'll take a look and try to educate myself on this topic. Thanks for the "heads up".

Assuming Salvador's X1M is operating properly, the spectral plots he placed in the Files section for 17M show products that are WAY too close in to the fundamental to ever be removed by passive L-C filters, regardless of their topology or complexity. The close in 12M "stuff" is likely far enough below the carrier to not effect signal quality

Hello, I can replay to a message from this group, I am a member but when I click on New Topic, nothing happens.
Does anyone have good info for using the new Yahoo groups? It is driving me crazy.

By the way I received my Pro today and it is working well. I have measured power on all 5 bands and would like to post data before I modify the final transistor.

Also would like to search the groups messages to find out how to open the transmit on the Pro. Can't search anything. The new groups are not cool.

We'll have to see what several radios look like. But as others have pointed out, a 9MHz IF/BFO is a poor choice for an 18MHz transmitter.

GA Ken,

According to the User's Guide for the X1M, under the 'Systems Menu' it is item number 11. "FBND TX:0" is the default value and limits the TXing to the 5 designated bands. I assume setting "TX:1" would open up the transmitter.

Anyway item #11 is the one you want. You do so at your own peril.

Almost in the same boat. Just received some new filter kits from
Kits&Parts for 17 and 30 meters. When they are in place I'll take a
look with my SDR receiver and see what the output looks like.
I think Charlie has been running his X1M on 17 meters. Maybe he has a
solution/comments.

Ken,

Technology is great when it works but only makes life more miserable when
it doesn't! OH well, guess we can't stop "progress." :-)

From: Dale Parfitt
Topic: 2714 Message: 2733

Hi Roger,
If possible, connect your X1M to the SDR with the appropriate attenuators in between to reduce the X1M's output to a safe level for the SDR. Hopefully then, stray coupling will be at a minimum. I can do the same test here with my K3/P3 and the spectrum analyzer- just need time.

Hi Dale,
I plan to use a technique you mentioned a few days ago - coax tee from the radio output going to a 50 ohm load and a short wire from the other side of the tee to leak rf for the sdr to look at. If need be, I did order the bandpass filters which have 6 dB bandwidth of about 200 KHz @ 7 MHz. Also have one of his lowpass filter kits that I can wire for 30 meters. It will be a while before I have the free time to get this together

Oh, also - Please put me on the list for the CW filter kit. Thanks!!

What is the insertion loss of the BP filters? Typically, BP filters that tight, have an appreicable in-band insertion loss.

Tnx,
Dale W4OP

Diz (W8DIZ) doesn't say on his website.

http://kitsandparts.com/bpf2.php

Also has an even tighter single band filter:
6 dB bandwidth is about 140 KHz @ 7 MHz

http://kitsandparts.com/univbpfilter.php

I did send him a note asking the question.

Seems reasonable. That is the issue with BP filters. So 5W in from the X1M will get 2.5W out of the filter.

Hi Dale,
I plan to use a technique you mentioned a few days ago - coax tee from the radio output going to a 50 ohm load and a short wire from the other side of the tee to leak rf for the sdr to look at. If need be, I did order the bandpass filters which have 6 dB bandwidth of about 200 KHz @ 7 MHz. Also have one of his lowpass filter kits that I can wire for 30 meters. It will be a while before I have the free time to get this together

Oh, also - Please put me on the list for the CW filter kit. Thanks!!

Almost in the same boat. Just received some new filter kits from Kits&Parts for 17 and 30 meters. When they are in place I'll take a look with my SDR receiver and see what the output looks like.
I think Charlie has been running his X1M on 17 meters. Maybe he has a solution/comments.

If the interferance on 17 meters is close to the band edge and is not to wide what about using a trap instead? You could also use a very high Q circuit at the interferance freq. to ground. Any thoughts?

From: Marcus Ward
Topic: 2741 Message: 2741

http://i.imgur.com/nIa829l.jpg

It arrived a little bit ago. I soldered the plug to a power supply and it fires up fine. Hooked it up to my antenna and the receive audio was great, as good as my FT450D. I'll need some antenna adapters to test it properly but so far I'm tickled to have it and can't wait to do some SOTA activations with it. My only bummer moment was the little plastic 'glass' over the lcd was scratched a bit but I think that's a minor quibble considering how it'll look after spending tons of time in my backpack.

Weight is 608 grams, if anyone here is a gram counter (I am. Years of racing bikes is hard to escape from).

Now I need batteries, a little antenna, and a lightweight keyer. So glad I found this group and this radio. I really wanted something for mountaintop activation but it seems like every offering in the non-kx3 price range is either ssb OR cw, or 2 bands, or some other limitation I didn't want to work under. This radio is the ticket!

Thanks all for letting me rave.

Regards,
Marcus

Traps are typically 2 element devices. If placed in series they are a parallel L-C. If to ground the are a series L-C. Either way, they are 2 pole devices and the ultimate rolloff takes place at -12dB/octave or -40 dB/decade. The first spurs on the 17M spectral plot appear to be closer than 130KHz from the carrier freq- well beyond the capabilities of traps. The other thing you have to worry about (in addition to the attenuation of the offending frequencies) is the return loss (or VSWR in ham parlance) of the trap at the pass frequencies- this will be a more difficult parameter to meet than the attenuation.

Well, my replacement radio should arrive tomorrow, and I can get cracking on the User's Guide revisions.

I need somebody to do some photos for me, if they could:

1. New front view -- assuming that that terrible red knob has been replaced.

2. Shots of the new screens -- I'll do any cropping, etc.

I have one of the new RS232 to BNC adapters on order, that should arrive tomorrow as well. Thus, I have a spare/excess to my needs one of the older ones -- needs the RS232 to BNC adapter, as I want to keep mine for other stuff. Free to a new home for the price of the shipping.

We are due for some snow <gasp> here in "Slower Lower" Delaware, so if the mail gal gets here -- my mail comes late afternoon, I can start work tomorrow evening. I am pretty sure the manual changes are going to be fairly mine. Charlie has nicely given me a list of stuff to be on the lookout for.

One issue I see with the external BPF is that the final is already amplifying all of the 'bad' stuff, so there will be a lot of wasted power.

However, without having visibility into the code, I'm not sure there is much else we can do.

For sure tho, I wouldn't transmit anywhere the radio is not spec'd for (any of the WARC bands, etc) without some kind of external filtering.

As Dale has already said tho, even this has limitations on some bands because of the IF frequency.

If we could get the source code....!

The decoder they use can give us 8 bands as it is, but there's obviously not the room inside to add another 2 Bandpass filters. I say 2 because the one 'catchall' BPF could be utilized as another band. However, the general coverage capability would be lost.

After looking at things, I don't think that the 9 mHz 'blowby' is that. I think it's just because there isn't any BPF for what it's receiving.

Marcus,

Congrats on the new radio. I was wondering though, you said the receive audio was as good as your FT-450? Most of us here have done a couple of mods to get good audio. Our rigs had issues with receive gain, as there was very little. So yours is really good straight out of the box? That would be a great improvement over earlier release units.

MHO for some suggestions on equipment...

Check out American Morse for a really nice qrp key. I have the Porta paddle and it works great. They have a good selection of keys to choose from and a couple of really compact keys.
Also LNR Precission now manufactures the Par Endzfed Antennas. The EFT 10/20/40 would make a great backpacking antenna.
Batteries, well you're on your own with that one. I use a 12v, 7.2 amp/hr sealed acid cell for my SOTA, camp, rv type ops. A couple of lbs US though!
Enjoy the rig. Maybe we'll meet on the air!
73,
Bill

That is a lot more loss than I was expecting. I was thinking 1 or
1.5dB. The W3NQN filters have approx 0.3dB losses, but the passband is
a megahertz or more wide. So, looks like it will be running close to
QRPp levels with the filters in place. I don't see an alternative, either.

Subject: [X1M_QRP-Transceiver] Re: Dang this radio is small!!

Well, my replacement radio should arrive tomorrow, and I can get
cracking on the User's Guide revisions.

I need somebody to do some photos for me, if they could:

1. New front view -- assuming that that terrible red knob has been replaced.

2. Shots of the new screens -- I'll do any cropping, etc.

I have one of the new RS232 to BNC adapters on order, that should arrive
tomorrow as well. Thus, I have a spare/excess to my needs one of the
older ones -- needs the RS232 to BNC adapter, as I want to keep mine for
other stuff. Free to a new home for the price of the shipping.

We are due for some snow <gasp> here in "Slower Lower" Delaware, so if
the mail gal gets here -- my mail comes late afternoon, I can start work
tomorrow evening. I am pretty sure the manual changes are going to be
fairly mine. Charlie has nicely given me a list of stuff to be on the
lookout for.

Hi Marcus,

You will have a LOT of fun with it, especially when you consider the price is in the same range of 2 or 3 band KITS, like you said , and then usually only one mode.PLUS most of them are not a 5 watt radio.

We like to think that this is one of the best support groups anywhere on the net. The radio is fantastic already, but some of us are hard core to the bone, experimenters and builders, so we are always looking for new little bells and whistles at cheap cost and easy internal installation, so you have some feature found on the Big 3 BIG RIGS !!

There is a built in keyer, so if you use that you won't have to worry about adding any extra grams there, if that is the proper term. I don't do grams etc. without a conversion chart :)

Welcome aboard and have a GREAT time with a TRUE radio, not some novelty item !!

Charlie, W5COV

Well, I hope my info is correct- I do give it some thought before hitting Send. But there are engineers out there far brighter than I am- so if I don't know I try to learn what I don't know. It's all fun stuff and I for one enjoy the process more than actually getting on the air. I do listen a lot though. Guess I'll always be an SWL.
I have completed a 4 pole CW filter design and am now awaiting more crystals for the build. But I have not yet confirmed my idea for auto switching the filter in and out will work. That's next. There may be an issue with filter centering also- but I won't know until I install it and take some Spectrogram plots.

Hi Marcus,
Try out the internal keyer. It has come a long way with the last two firmware upgrades. I enjoy using it and do not have an issue with it, although I know some others would like to see a few more changes.

It arrived a little bit ago. I soldered the plug to a power supply and it fires up fine. Hooked it up to my antenna and the receive audio was great, as good as my FT450D. I'll need some antenna adapters to test it properly but so far I'm tickled to have it and can't wait to do some SOTA activations with it. My only bummer moment was the little plastic 'glass' over the lcd was scratched a bit but I think that's a minor quibble considering how it'll look after spending tons of time in my backpack.

Weight is 608 grams, if anyone here is a gram counter (I am. Years of racing bikes is hard to escape from).

Now I need batteries, a little antenna, and a lightweight keyer. So glad I found this group and this radio. I really wanted something for mountaintop activation but it seems like every offering in the non-kx3 price range is either ssb OR cw, or 2 bands, or some other limitation I didn't want to work under. This radio is the ticket!

Thanks all for letting me rave.

Regards,
Marcus

This run of radios has already incorporated a zero ohm jumper on the LM-386 , so they should have the same amount of audio output as we do that modified ours, only it comes right out of the box now with that done.

The company has been VERY GOOD at implementing our change suggestions. However it is a major battle for Importcommunications and WiMO plus the other distributors and dealers to get ANYTHING technical conveyed to the Chinese. The factory does not have anyone even close to understanding English, let alone being fluent in it , so these guys deserve a HUGE THANK YOU for getting some pretty technical issues communicated well enough that the Chinese were able to implement the changes !!

They work behind the scenes and deserve to be recognized for the monumental task that they have successfully managed to get incorporated into one GREAT LITTLE RADIO !!!

My last message was interrupted .....
Here is the wattage report for my radio as received out of the box:
Powered at 13.77 volts
3.8mhz---6.1 watts
7.2mhz---5.0 watts
14.2 mhz-5.9 watts
21.3mhz-4.9 watts
28.5mhz-4.0 watts

Dale,
Do you have any tips for me concerning getting to the final transistor and removing it? My question centers on if there are issues or areas I need to pay special attention.

I figured you were the person to ask because you recently replaced a final for someone.
Thanks,
Ken

HFProjects I believe sells a manual LPF kit as well a relay switched set. Diz's individual LPF should work and be easy and small solution.

Ken, I took the cover off of the final and then it is a piece of cake. It is a real nearly impossible job if you try to leave the final cover on. I would also HIGHLY recommend that you epoxy the nut to the case, while you have it apart. That way it would be MUCH easier if you have to get to the final again. With the nut epoxied to the case, you can take the scre out and get it back in, without removing the cover again.

Hi Dale,

It's pretty good, not quite as 'touchy' as the keyer in the Yaesu but damn the side tone is obnoxiously loud. Is there anyway to turn that down? It's probably perfect for a windy summit but in my house or headphones it's blowing my eardrums out.

Hi Charlie,
By the final cover you mean the bottom case half correct?
I am guessing you remove the knobs, shaft nuts, front allen screws,
rear allen screws, and the bottom screw.
Did I miss anything?
As you can tell, I haven't had the radio apart other than the top cover.

Ken, I took the cover off of the final and then it is a
piece of
cake. It is a real nearly impossible job if you try to
leave the
final cover on. I would also HIGHLY recommend that you
epoxy the nut
to the case, while you have it apart. That way it would
be MUCH
easier if you have to get to the final again. With the
nut epoxied
to the case, you can take the scre out and get it back
in, without
removing the cover again.

One of the projects that we are working on , besides the CW Xtal Filter board , that Dale is working on , is a board that will be capable of holding most likely 5 filters for bands of your choice. It will include a rotary switch and relay switching of the filters. If you are not in a need it right now , kind of hurry, we are pooling our talents and resources to produce some accessories like the band switch and probably a few more items as we go along and get more feedback for what people want to see to be able to add to the X1M.

This group is VERY interactive and several extremely smart experimenters on here, but since we do these kit accessories on a not for profit basis and have regular jobs and businesses in most cases, it takes a little time from concept to completion. There is room for EVERYONE on here to contribute their ideas or things that they build to use with the X1M.Many have other talents , such as drawing up PC boards and or schematics , which leaves more free time for Dale and others to put their knowledge to work on other things if we have people willing and capable of helping in all areas.

We are more like a family of owners and get to know each other and become friends, rather than just a cold standard canned type response to most questions and projects and we share the information within the group.

LOL They come that way from the factory and in the manuals you will find that we recommend turning that down and also peaking the microphone gain while you have the top off . LOTS of good written and photo information in the group home page. If you need help identifying the pots or are not clear after reading and looking at the photos, we will be more than happy to help you with it. You just have to remove the top cover to access the side tone pot and the microphone pot.

No Ken, on the bottom board there are two separate shielded covers that
are soldered in place. One goes over the final and the other one goes
over the filters.

Ah very good Charlie, I got the sidetone set. Seems like the pot is like the temp adjustment in a shower. There's only a tiny spot where it's okay, all the other settings are too loud (hot) or quiet (cold). ;)

Thanks for the pointer to find that in the manual.

Regards,
Marcus

I have been a little busy to get my manual in the Files section regarding replacing the PA transistor. As Charlie suggested, once you get the flat head screw out and have the radio disassembled. epoxy the nut to the PA transistor tab (using the flat head screw to keep the nut centered while applying the epoxy.
Initially the nut will end up inside the PA shield- so it's a bit like a childs toy of years ago where you will have to shake the board until the nut falls out of the PA shield hole. A vacuum desoldering gun may be essential to clearing the D-S-G holes out.

Dale

2767. ATTN - Ed and the Group: Initial thoughts on the new X1M version

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-10 16:28:57 UTC
From: <pal350@...>
Topic: 2767 Message: 2767

Ed et al,

The original X1M simply had too many bugs in it for me and I returned it. After reading about the new version, I decided to give it another shot. Received it yesterday and have spent several hours with it. I had three main problems with the original version:

* The filtered ham bands had incomplete US coverage.

* The P.A. in my particular example exhibited some serious instability. This was present in the filtered bands to some extent, and was a lot worse outside them. Power jumped at odd times between 0.5 and 7 or 8 watts, a lot of which was spurs and garbage.

* CW mode was unusable due to a cyclic power output drop that resulted in dropped character elements.

The coverage issue has been taken care of in the new version. More on that below.

I think the second problem may have been a fault in my particular set, since I didn't read too many complaints about instability. So far my set has been stable. Testing continues.

The CW problem was reported by others and pretty much made CW operation impossible. That particular problem appears to be solved in the new version,

HOWEVER I ran into a new CW bug. The attack time on initial keydown is not fast enough, which causes the initial dit or dah to be either lost or shortened. For instance, if I send a "VVV" in manual keyer mode, what I hear in a local receiver is "UVV". The first dit gets cut off. If I send the series "VVV VVV" I hear "UVV VVV", etc. In other words, I have the problem if I let the radio switch back to receive mode. It's only the very first word element sent when the set is in receive mode that's goofed up. The first dit often gets dropped, and the first dah often gets shortened and sounds like a dit.

This is problem enough for slow guys like me. But for people who are really good at CW and send fast and like short break-in intervals, this is gonna cause real havoc since it happens with the keyer as well as in manual mode.

I'm guessing this could be caused by a poorly-handled interrupt in firmware, or a break-in or T/R relay that isn't fast enough. Ed, I would be very interested to know if the developers told you how they fixed the original CW problem. Was it an interrupt issue?

People with new version sets, please check for this CW situation.

With the added coverage on the filtered bands and CW at least partially usable, this version is a keeper for me. However, the developers need to address the new CW bug (if as I suspect it proves to be general), with a view toward fixing it in firmware if possible.

Also, I'd like Ed to relay the following upgrade requests to the developers:

1) Add the WARC bands to the filtered coverage. Can this be done by using the filters already present? For instance, could the 15m low pass filter be switched in for 17m, etc? 17m would be especially useful since it's been one of the favorite HFpacker bands.

2) Add an output setting capability to vary power out from 0 to 5W. This will allow QRPp ops for the truly adventurous. :)

I know every set will be a different, but here are the IF, LSB, and ISB alignment values I ended up with:

IF OFFSET: 08999554
LSB BFO: 08998450
USB BFO: 09000652

Hi Mark,
Do you have a spectrum analyzer- or perhaps a good HF RX?
The issue we saw was not that the first portion of a dot or dash (when the rig initially goes into TX mode) was clipped- but rather it was on the RX frequency (which is different from your TX frequency by your tone setting). This issue was solved in the last firmware upgrade. I typically run at 20-30 WPM and see no issues.

Dale,

I'm listening on a good RX using headphones as I send, so I'm hearing the X1M's actual transmitted sig.
There's definitely some weirdness going on with the first dot or dash when the X1M is in RX mode.
This could be my particular set.

Are you using the new X1M or the original version with upgraded firmware?

PRO with upgrade. You need to be listening on the RX frequency when you 1st TX CW. Do you hear the first bit of your 1st character?
How do you have your CW BFO set up. The only way to have the RX freq readout to be accurate is to set the CW BFO Offset= to IF Offset.
What is your firmware version?

The way I set it up:

IF offset = 8999554
CW BFO = 8998753

CW is 801 Hz under IF. This gives an 800 Hz tone in USB on the test receiver.

Tried setting CW = IF. That requires me to tune down 800 Hz in USB on the test receiver to get an 800 Hz tone.

Symptom persists. I don't think this has anything to do with how the CW BFO is set up.
I don't use CW a lot, but when I do it's usually with mil surplus friends who are using radios
that derive CW by injecting a tone into their xmitter's balanced modulator. When I say "meet on
7125", both of us tune to 7125.000 indicated and have at it. Usually our radios don't have a
separate CW mode switch setting - we just connect a key in USB mode. When the key is operated,
the radio injects an 800 Hz tone into the balanced modulator and that's what the guy on the other
end hears. No messing with RIT at either end, no chasing tails. That's why I set up my CW per the

top parameters.

But here it doesn't matter how I set up CW, off-set or down the center of the IF...still getting that
first character element cut off.

First thanks to Charlie and Dale for their guidance concerning changing the final transistor. I hope to do that job tonight.

Next, yesterday (Monday) I received my x1mPro. So far I love it and have made contacts with it. Good power output and loud audio (after adjusting the mic pot). My first contact said the audio sounded restricted like an old fashioned phone patch.
I monitored my audio and I agree with him. Last night I swapped out the mic element with all those in my junk box. The very last one I tried had good sounding audio. I confirmed it with a local who knows my voice. So if you get crummy audio reports, it can be improved.
The only real issue I have had with the radio has been with the mic itself. I lost all audio on transmit. Checked for broken wires but found none. I resoldered every connection in the mic and that fixed the problem.
Bottom line the mic is of VERY poor quality. Hopefully my repair will hold up.
More to follow this evening or tomorrow after I change the final to its higher gain twin.

I forgot to include in my last email, my new X1Mpro does not have a serial number sticker on the back. I haven't seen one in the display either. Does one exist?

GA Dale,

Just got my new X1M. I noticed its manufacturing date was back in mid October. Does that mean I need to do a software update? I seem to remember that a software update came out sometime in November. Maybe that could be Mark's problem as well.

There's definitely some weirdness going on with the first dot or dash when the X1M is in RX mode.
This could be my particular set.

Are you using the new X1M or the original version with upgraded firmware?

Sent: Tuesday, December 10, 2013 2:08 PM
Subject: Re: [X1M_QRP-Transceiver] ATTN - Ed and the Group: Initial thoughts on the new X1M version

The way I set it up:

IF offset = 8999554
CW BFO = 8998753

CW is 801 Hz under IF. This gives an 800 Hz tone in USB on the test receiver.

Tried setting CW = IF. That requires me to tune down 800 Hz in USB on the test receiver to get an 800 Hz tone.

Symptom persists. I don't think this has anything to do with how the CW BFO is set up.
I don't use CW a lot, but when I do it's usually with mil surplus friends who are using radios
that derive CW by injecting a tone into their xmitter's balanced modulator. When I say "meet on
7125", both of us tune to 7125.000 indicated and have at it. Usually our radios don't have a
separate CW mode switch setting - we just connect a key in USB mode. When the key is operated,
the radio injects an 800 Hz tone into the balanced modulator and that's what the guy on the other
end hears. No messing with RIT at either end, no chasing tails. That's why I set up my CW per the

top parameters.

But here it doesn't matter how I set up CW, off-set or down the center of the IF...still getting that
first character element cut off.

2779. Re: [X1M_QRP-Transceiver]serial number question and some issues addressed

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-10 21:23:37 UTC
From: Charlie , W5COV
Topic: 2779 Message: 2779

The PRO used to have the serial number embedded in the firmware. When we started doing firmware updates they did away with serial numbers completely. I don't have a new radio, but do have the original and the PRO from the shipment previous to this one. There are no serial numbers through that lot if the radio has been upgraded.

It would be helpful for us to help you, if you push and hold F5 and see which firmware version that you have and post that when you post.

We have been through many changes. The CW and keyer has been through even more revisions. Also helpful is what version radio you have. Since now the original X1M can be upgraded to a PRO with the faceplate change, please mention if it is this radio, or a PRO, and again the version of firmware that you are running.

Dale and I have not seen the radio from the latest shipment or the faceplate that is shipping for the upgrade. I have however successfully experimented with a PRO faceplate from the previous run on an original X1M and have noted no problems, except the same ones noted with the PRO. So since we are kind of working not blind , but a little in the haze, we need you to give us as much information as you can, so we can attempt to identify if there is a problem in this new run or it just needs a firmware update.

No there is no more room for filters inside of the radio. Once we get through this "growing phase" of this shipment of X1M's and attempt to get everyone up and running properly, one of the plans already on our sketch pads , is a rotary switched set of filters, switched by relays, as an external addition for 5 additional bands for the X1M. If you are in a hurry and need it right away, it is not going to happen by Dale or I. We both have other business and family time , plus our own operating time , that we need to unwind and only do the X1M as a hobby, more correctly described as a "labor of love."

I too have run the X1M on 17 meters successfully with no complaints, using a home built 7 element Chebyshev low pass filter on the output , with good reports. HOWEVER people today tend not to be critical enough of our signals and I have not yet put mine on the SA. I was getting ready to do that last night, but my brother was in ICU at the hospital and is now in a regular room, so "perhaps" I will get it on the Analyzer tonight.I would still advise CAUTION using it outside the filtered bands without at least minimally a filter on the output. Due to the radio design (which is a common design to use 9 MHz. and has been around for years) then 17 METERS is a band to especially take caution operating on, or anywhere in the 18 MHz. range. Very nice 2nd harmonic of

9 MHz., that many of us old timers remember dealing with as Novices. Not an issue that you see so much today, but it still exists.

The microphone is not a "standard" component on the X1M. I have seen more than one "brand" used and they are repurposed speaker microphones, so another helpful tip to you new to the radio, is to write down your color of wires and connections to the plug. We have also done a couple of simple Exacto Knife trimmings inside of the mic and it helps. Plus one of the first things to do, as covered in the instructions, is to remove the top cover and set your sidetone volume and also your mic gain. Both of these pots are single turn and actually do have that proverbial "SWEET SPOT" so it is kind of a MUST in my opinion, before you start looking at more radical approaches and changes.

More later, if you have a problem, or if I remember something helpful. We once again have our volunteer "manual writer" with a radio in hand. Paul Ross , is our "unofficial" manual author, so make certain he gets any new information. Please study the files and photos, many of these issues have been covered and a little reading of them can be Chicken Soup for the Soul of an X1M user.

ENJOY !!!

That is good news in a way Paul- as it demonstrates the the latest batch of rigs does not have the most recent firmware. Thus the issue with the first part of the first code element being on the RX frequency. It will sound clipped if listening to the TX on a receiver. But it is a result of the frequency being incorrect during that transition. This was not discovered until some time in September or early October because before the October update, CW Tone did not work properly.
I reported the problem in mid October accompanied by a spectrum analyzer plot (that I believe is in the photos section) that showed the beginning of each CW TX cycle starting out on the RX frequency. Ed was able to communicate the issue to China and it got fixed in the November release.

From memory (?):

The CW freq shift issue which I recently posted about was fixed.

I think the speed readout was also fixed in this version. Previously, setting at 10WPM actually was 20 WPM.

RIT step was increased from 1Hz/step to 10Hz which now yields a very usable RIT rate.

I think that was it. The major update was October which fixed numerous keyer issues, Split on CW, RIT and CW Tone.

For those of you who will be adding my AGC board- note that China has implemented my increased audio gain mod in all of the new radios- so ignore that section of the manual.

We are hoping that Memory--> VFO will be in a newer update as it does not presently exist. After that, I am out of ideas.

Did I miss anything Charlie?

No memory to VFO that I can find. Just got mine this afternoon. Running initial "smoke test," and shaking it down. XYL goes to play cards tomorrow, so just me and the dog. I need to get his code speed up.. we shall see. His paws are a good fit my my old J-38... He was greatly disappointed that it was the postman, not the DHL guy that delivered the package...

I will work on the manual ASAP. Just going through it line by line and doing a "reality" check. I am afraid I need to leave in some of the alignment stuff, as on an AM station, the USB and LSB sound SLIGHTLY different. I am not going to fool with mine. The side tone needs to be tamed down. No surprise there. Lots of audio, so that seems to have been cured.

NICE new knobs -- both the same. Red knob has gone... That is a good thing.

2793. New AGC Kit Run

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-10 23:19:51 UTC
From: Dale Parfitt
Topic: 2793 Message: 2793

Charlie, W5COV has been kind enough to take over the AGC kitting and shipping. I sheared the boards today and posted them to him. Charlie anticipates he can begin shipping by next Monday. Please contact W5COV directly regarding payments etc.

Subject: Re: [X1M_QRP-Transceiver] ATTN - Ed and the Group: Initial thoughts on the new X1M version

The way I set it up:

IF offset = 8999554
CW BFO = 8998753

CW is 801 Hz under IF. This gives an 800 Hz tone in USB on the test receiver.

Tried setting CW = IF. That requires me to tune down 800 Hz in USB on the test receiver to get an 800 Hz tone.

Symptom persists. I don't think this has anything to do with how the CW BFO is set up.
I don't use CW a lot, but when I do it's usually with mil surplus friends who are using radios
that derive CW by injecting a tone into their xmitter's balanced modulator. When I say "meet on
7125", both of us tune to 7125.000 indicated and have at it. Usually our radios don't have a
separate CW mode switch setting - we just connect a key in USB mode. When the key is operated,
the radio injects an 800 Hz tone into the balanced modulator and that's what the guy on the other
end hears. No messing with RIT at either end, no chasing tails. That's why I set up my CW per the

top parameters.

But here it doesn't matter how I set up CW, off-set or down the center of the IF...still getting that
first character element cut off.

2794. Comparison LF-RX X1M Pro <--> TS-590S

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-10 23:36:09 UTC
From: <df2jp@...>
Topic: 2794 Message: 2794

Hi folks,

I´ve made a comparison of this both TRX last night in OPERA32 on 137kHz.
X1M was connected to my resonant Inverted-L Antenna, the TS-590S to a Wellbrook RX Loop.
Thats the result:
Kenwood TS-590 with Wellbrook Loop Antenna X1M with Inverted L-Antenna

05:58 136 DK7FC Op32 +0 dB Fade: 1%
05:55 136 UW8SM Op32 -36 dB Fade: 8%

Topic: 2767 Message: 2795

This is interesting. Last night messing with my new shipment pro I didn't notice the first dit of the string of V's I sent to test the keyer getting cut off

Also ATT is gone from the menu, in its place is KS (keyer speed).

When I set the keyer speed to 10, it was 10wpm.

I'll have to check and see which firmware I am on. I'm at work right now and didn't think to bring it with me.

Regards,
Marcus

From memory (?):

The CW freq shift issue which I recently posted about was fixed.

I think the speed readout was also fixed in this version. Previously, setting at 10WPM actually was 20 WPM.

RIT step was increased from 1Hz/step to 10Hz which now yields a very usable RIT rate.

I think that was it. The major update was October which fixed numerous keyer issues, Split on CW, RIT and CW Tone.

For those of you who will be adding my AGC board- note that China has implemented my increased audio gain mod in all of the new radios- so ignore that section of the manual.

We are hoping that Memory--> VFO will be in a newer update as it does not presently exist. After that, I am out of ideas.

Did I miss anything Charlie?

Topic: 2794 Message: 2796

The AGC board is audio derived and effects the MC1350 which is after the crystal filter- thus has no effect on IP3.

2797. Re: [X1M_QRP-Transceiver] Comparison LF-RX X1M Pro <--> TS-590S

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-11 00:29:26 UTC
From: Charlie , W5COV
Topic: 2794 Message: 2797

Hi Joe,

THANK YOU, for posting the numbers !!! I haven't had a lot of free time to experiment on 2200 meters. I do have the 1750 meter station up and running, but we have been down to zero or below at night for several days now and I need to do a little more antenna work , to improve my signal. I have listened quite a bit on 600/630 meters with it .

Really nice heads up comparison !! I hope you will continue to post your information and experience, because my "radio home", plus design and building projects are all 2 MHz. and below.

I have wished and asked for one very small firmware change for the X1M, but there seems to be just a couple of us that want it and have a REAL use for it , and that is to drop the lower frequency limit to at least 50 kHz. I have done the change on my own controller on a homebuilt rig, that uses basically the same scheme as the X1M and it takes less than 5 minutes to accomplish and no cost involved for hardware.

Some others "MIGHT" even want a little lower bottom end for several of the USA stations they use as a SID monitor reference. It would also add WWVB here in the USA. Some run in the 18 to 20 kHz. range.

My 4,000 meter station sits by quietly in the corner. My nice Tektronix high power amp awaits my attention. Since it weighs in at 140 pounds it is difficult for me to move around and to get in from the work bench to the test bench and back and forth. The X1M and related projects still have plenty of hours of work in front of me. I do enjoy working on the X1M, it is a true "labor of love" to me to see what the original radio was and the excellent radio that it is today, so it is time well spent.

Maybe one day we will attract even more people with a lot of interest in the frequencies in the experimental bands and we will one day see the X1M software changed to allow us to use it below 100 kHz.

Nice impressive numbers for the X1M . Keep up the good work Joe, I'll be looking forward to seeing more on what you are doing with the X1M on 2200 meters.

☐

As I continue work on the CW filter- what is the preferred CW Offset that you guys like?

I personally use 500Hz, but that may be a bit low for some of you. A show of hands please- majority wins. As of this writing, this is still a democracy.

You have to push and hold the F5 button for a few seconds for it to display.

2801. New Final Transistor Wattage Results

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-11 04:58:39 UTC
From: <disklog@...>
Topic: 2801 Message: 2801

Hello All,
This evening I replaced the final transistor in my X1mPro with the higher gain RD16HHf1 Mosfet.
One needs to judge for themselves if the change out is worth the effort. The job was not difficult, and could be done by anyone with reasonable soldering and desoldering skills. A proper soldering/desoldering station is needed to avoid damaging the board.

Frequency Stock output New output
3.8mhz 6.1watts 9.0watts
7.2mhz 5.0watts 8.1watts
14.2mhz 5.9watts 7.9watts
21.3mhz 4.9watts 5.8watts
28.5mhz 4.0watts 5.8watts

All readings taken at 13.77volts.
These readings were taken with a Bird watt meter and the usual Bird tolerance applies.
It should be noted that the internal low pass filters seem to have ripple and the output can be a bit greater or less with only a slight frequency change.
I chose to test near the center of the voice band.
All tests done in CW mode to make reading easier. A peak reading meter on SSB might show greater peaks. I also tested with a "cheap" peak reading meter and greater peaks were seen but I don't trust that meter.
There you have it. I welcome any comments or suggestions.
Ken N2LZV

Hi Ken,

Thanks for doing the change and doing the reports on the numbers. It appears to be a newer transistor and I have a couple on hand, after you first mentioned it. It looks like a good transistor to use as a replacement.

Next time I am down to that board, I might give it a try.

Hope you will keep us informed on how it works out for you.

It is always good to have people that look for improvements or mods and changes and are willing to try them and share their results with the group.

Charlie, W5COV

2803. Additional LPF auto switching questions

Yahoo group: X1M_QRP-Transceiver (2013)

From: Stephen Farthing
Topic: 2803 Message: 2803

Charlie and the group,

I hope to get my XM1 soon as my pal who has it in the USA is well enough to ship it to me.
I want to design an external LPF which will be automatically switched in when the band is selected. But i do not know if there is a way to get the band info from the radio. Is there?

Thanks and greetings from a cold Budapest.

Steve G0XAR

Hi Steve,

Is that where you are going to be living now ? It has been zero F or below every night here for at least a week, with not much better forecast in the near future and I have a little 1750 meter outside antenna work that I need to finish up.

At present I know of no way to do that unfortunately. We have pretty much used up all of the software memory room and also have used all of the function buttons and switches , both hardware and software, with multi use already. We have pretty much maxed out the radio, without reallocating something. However the changes have all been for the better, to make it a MUCH better radio than was their original unit and have added features that were not planned on being available on the original radio.

We still find an occasional bit of space to add some other internal changes, but even that is getting very limited now.

Pretty much everything is going to have to be external, which really has been my idea all along for adding additional filters , since if I add all of the WARC bands and the Experimental bands above 100 kHz. through 30 MHz., I need I believe it is going to take 10 additional filters.

The extra bands and filters have just become a priority on my "X1M spare time projects" list, just this week, so I have only done a bit of preliminary study on being able to rig a way to switch the external filters from the radio.

This is where we can really use your talents in Arduino , Pickaxe, Raspberry, Full Atmel , or some other way to see if we can accomplish it , to see if we can find a way that is not a purely manual operation. Maybe even a bit of good old analog devices tossed in for good measure :)

The logic lines are easy enough for the most part to access in the X1M, however it is going to require some creative thinking to accomplish switching the external filters with the internal logic functions. I am not saying that it can't be done, but it is not going to be simple. I haven't COMPLETELY given up just YET , but am certainly nearing the end of ideas on how to accomplish it.

I have a couple of projects this week for group members that will be getting bench time this week, but after that I am clearing the bench to work on this project, while Dale works on the CW crystal filter kit to install internally.

Just this evening I have been sourcing relays and any other parts that I think that I might need to start working on one possibly 2 prototypes of an external filter box and since I haven't even sketched any of this on my pad yet, but have a couple of ideas floating around in my head, I am most certainly OPEN TO ANY AND ALL IDEAS AND SUGGESTIONS FROM ANY GROUP MEMBER !! EVERYTHING no matter how far out there as it might seem to some WILL get a good hard look at and PUT ON THE TABLE !!

KEEP WARM MY FRIEND !!

Going to crawl in the nice warmed up bed , and give this some more thought and hopefully something will come to me. It is my ONLY PRIORITY PROJECT , once I do the things scheduled on the bench this week.

Best Regards ,
Charlie , W5COV

The idea of using Arduino is definitely possible. We already have the ability to read current frequency for each VFO. We would need to pass that reading into a simple if/then. It would just be a statement like "if freq < Xa and >Ya then filter_a = true" where Xa is an upper band limit and Xb is a lower band limit and filter_a is a relay trigger. Is it possible to have a command pass-thru though so that we could still have rig control with the external filter attached? My coding skills are still 1983 unfortunately, but I can limp through it using examples from existing code snippets. I was able to successfully make a fox-hunt box out of an Arduino Leonardo and a Baofeng uv3r this way.

I also had a chance to experiment with the extra DB9 pins that seem to be tied to the internal filters. I had thought they might be for triggering the internal filters manually, but I think they are there for triggering external filters in a PA. Yet another device that would need some sort of pass-thru. I'm hoping that this is how the 20 watt amp they were talking about would work.

I'm looking at the HardRock 50 project as a nice amp to use with the X1M at home. Has anyone else looked at this one?

I do have the 1750 meter station up and running, but we have been down to zero or below at night for several days now and I need to do a little more antenna work , to improve my signal. I have listened quite a bit on 600/630 meters with it .
>
> Really nice heads up comparison !! I hope you will continue to post your information and experience, because my "radio home", plus design and building projects are all 2 MHz. and below.
>
> I have wished and asked for one very small firmware change for the X1M, but there seems to be just a couple of us that want it and have a REAL use for it , and that is to drop the lower frequency limit to at least 50 kHz. I have done the change on my own controller on a homebuilt rig, that uses basically the same scheme as the X1M and it takes less than 5 minutes to accomplish and no cost involved for hardware.
>
> Some others "MIGHT" even want a little lower bottom end for several of the USA stations they use as a SID monitor reference. It would also add WWVB here in the USA. Some run in the 18 to 20 kHz. range.
>
> My 4,000 meter station sits by quietly in the corner. My nice Tektronix high power amp awaits my attention. Since it weighs in at 140 pounds it is difficult for me to move around and to get in from the work bench to the test bench and back and forth. The X1M and related projects still have plenty of hours of work in front of me. I do enjoy working on the X1M, it is a true "labor of love" to me to see what the original radio was and the excellent radio that it is today, so it is time well spent.

From: ken fest
Topic: 2803 Message: 2810

I have built two HF amps based on the 2009 QST homebrew challenge winner. It uses two 98 cent switching transistors. With less than 2 watt drive it outputs 60 watts on 20 meters. The output varies on the other bands with the least output on 10 meters.
This amp is an easy inexpensive build and works well as a QRP amplifier. I also adapted an Ebay Kenwood switchable low pass filter board on the output of the amp.
I can't recommend this amp strong enough for our purposes. Less than $30 dollars and you have a nice amp.

Hi Charlie,

All being well i wil be living here pretty much permamently in the latter half of next year.
Which begs the question are there any Hungarians on the list. If so please drop me a line off list. I need to find some QRP buddies here.

Thanks for the answer re the LPFs. Can someone verify that, when using computer control, the XM1 passes the operating frequency across the serial interface to Ham
Radio Delux. My simple idea is to build an additional filter board, external to the radio which will read the operating frequency and switch in whatever filter is required. Programming this is not rocket science. So if the microcontfroller can read from the serial port and switch in the desired filter thats pretty much it. I would choose to use the standard GQRP filterdesigns, which I believe Hans Summers uses (or did when we were kitting stuff) .

When my radio arrives i want to pop over to see my friend Jan Verduyn, G0BBL who has the skills and test equipment to properly measure the performance of this radio. Once I know that I will publish the resultshere. I also want to see what data is passed across the serial interface.

It did also occur to me that we could cheat a little and put the additional filters in a box with an ATU and bridge with the band being selected manually.

Sorry about the rubbish typing, i tripped this morning aand my left hand took most of the impact. I dont thing i broke any bones but it sure hurts....

I have built two HF amps based on the 2009 QST homebrew challenge winner. It uses two 98 cent switching transistors. With less than 2 watt drive it outputs 60 watts on 20 meters. The output varies on the other bands with the least output on 10 meters.
This amp is an easy inexpensive build and works well as a QRP amplifier. I also adapted an Ebay Kenwood switchable low pass filter board on the output of the amp.
I can't recommend this amp strong enough for our purposes. Less than $30 dollars and you have a nice amp.

The idea of using Arduino is definitely possible. We already have the ability to read current frequency for each VFO. We would need to pass that reading into a simple if/then. It would just be a statement like "if freq < Xa and >Ya then filter_a = true" where Xa is an upper band limit and Xb is a lower band limit and filter_a is a relay trigger. Is it possible to have a command pass-thru though so that we could still have rig control with the external filter attached? My coding skills are still 1983 unfortunately, but I can limp through it using examples from existing code snippets. I was able to successfully make a fox-hunt box out of an Arduino Leonardo and a Baofeng uv3r this way.
I also had a chance to experiment with the extra DB9 pins that seem to be tied to the internal filters. I had thought they might be for triggering the internal filters manually, but I think they are there for

triggering external filters in a PA. Yet another
device that would need some sort of pass-thru. I'm
hoping that this is how the 20 watt amp they were talking
about would work.
I'm looking at the HardRock 50 project as a
nice amp to use with the X1M at home. Has anyone else
looked at this one?

I remember reading the original article and when Ken mentioned it the other day I did go back to the QST archives and look it up to read the article again. (IF you are an ARRL member this is a great service for looking up material. Actually it is the only use I have for any of the ARRL services)

I posted this 20 watt one the other day and to put it mildly looks extremely conservative on the output , that I think is a good buy in kit form, if building from scratch isn't your thing. These two guys produce EXCELLENT kits and products , from all of the reviews that I have read and even to me, someone on an extremely limited budget, the price looks just great . http://www.qsl.net/k/k5bcq/Kits/Kits.html Go to kit #15 a little more than halfway down the page.

I have several e-mails to answer, so this is a general disclaimer, I HAVE NO FINANCIAL OR OTHER INTEREST IN ANY PRODUCTS OR SERVICES PRODUCED OR SOLD BY ANYONE.

*** THE ONE EXCEPTION FOR FULL DISCLOSURE IS I WILL BE KITTING THE AGC ADD ON KITS FOR THE X1M, DEVELOPED BY W4OP, STARTING ON MONDAY, BUT THIS IS A NOT FOR PROFIT ENDEAVOR, JUST TO KEEP THE KIT AVAILABLE FOR ALL OF THE NEW OWNERS***

If you are a scratch builder , the QST article is one that is still the basis of many home built amplifiers today. I have a breadboard built up based loosely on this amplifier that is my "test bed" for all of my amplifiers, especially for the experimental bands.

Hey Ian,

You must be back from your trip. Hope it was a great one, and I know that it was well deserved.

The "S" meter idea as far as I know , did not make it further than the discussion phase . Dale was going to see if it was possible to use one fourth of the AGC chip possibly for it, but it did not appear to be too easily accomplished , but when it really got dropped , was when Dale decided to use a different chip and there was then no electronics to start the chain.

It is always possible to do it, but more people need to be involved in actually designing , building, and testing, all of the proposed mods . Dale especially with his great RF and radio electronics knowledge, also has a full time company to run, so he actually loses money when he works on X1M projects . I too build projects and kits plus other items for people, plus my electronics knowledge is in the industrial field. I am a retired Instrument and Control Engineer , for power plants.

Plus I suffer from a brain injury so I have to ask some more questions to fill in some electronics theory "holes" that I may or may not have once known prior to my injury. So our engineering time is "free," to X1M users when we have the spare time and ability. Dale and I "adopted" the X1M, because we could see so much potential in it , but it just wasn't being brought out. So it is a true labor of love , ANYTHING that we do for the X1M and we make NO money off of any X1M radio, device , or accessory. We sell any kits just at parts and shipping cost. ALL of the engineering and our ordering boards and parts, plus shipping materials come out of our own pockets right up front.

Everyone has a special set of skills and can probably contribute in some manner or method, an accessory for the X1M. If you don't have a breadboard , I would recommend buying one. They are great fun and make it easy to experiment with. Many parts today are so cheap that one can let the good smoke along the way and usually not lose very much money. I let the smoke out of several IRF510's when I first started learning how to build MOSFET power amps.

Since we have a nice influx of new users , perhaps someone else will take up work on the "S" meter circuit.

Dale is currently working on a CW Crystal filter that will fit inside of the radio. I am just getting the parts ordered and am preparing to do some work on the external filter board , to try and give Dale some more time.

Just jump in and do a little building and make a few mistakes on a breadboard and when you are done share it with the group and we will all benefit from it. There is room for everyone !!!

I have one here still in the bag. I have the box, heat sink, and filters for 20m & 40m but have not got around to building it. Too many projects and not enough soldering iron operators.

I remember reading the original article and when Ken mentioned it the other day I did go back to the QST archives and look it up to read the article again. (IF you are an ARRL member this is a great service for looking up material. Actually it is the only use I have for any of the ARRL services)

I posted this 20 watt one the other day and to put it mildly looks extremely conservative on the output , that I think is a good buy in kit form, if building from scratch isn't your thing. These two guys produce EXCELLENT kits and products , from all of the reviews that I have read and even to me, someone on an extremely limited budget, the price looks just great . http://www.qsl.net/k/k5bcq/Kits/Kits.html Go to kit #15 a little more than halfway down the page.

I have several e-mails to answer, so this is a general disclaimer, I HAVE NO FINANCIAL OR OTHER INTEREST IN ANY PRODUCTS OR SERVICES PRODUCED OR SOLD BY ANYONE.

*** THE ONE EXCEPTION FOR FULL DISCLOSURE IS I WILL BE KITTING THE AGC ADD ON KITS FOR THE X1M, DEVELOPED BY W4OP, STARTING ON MONDAY, BUT THIS IS A NOT FOR PROFIT ENDEAVOR, JUST TO KEEP THE KIT AVAILABLE FOR ALL OF THE NEW OWNERS***

If you are a scratch builder , the QST article is one that is still the basis of many home built amplifiers today. I have a breadboard built up based loosely on this amplifier that is my "test bed" for all of my amplifiers, especially for the experimental bands.

Charlie , W5COV

On 12/11/2013 7:51 AM, ken fest wrote:

I have built two HF amps based on the 2009 QST homebrew challenge winner. It uses two 98 cent switching transistors. With less than 2 watt drive it outputs 60 watts on 20 meters. The output varies on the other bands with the least output on 10 meters.

This amp is an easy inexpensive build and works well as a QRP amplifier. I also adapted an Ebay Kenwood switchable low pass filter board on the output of the amp.
I can't recommend this amp strong enough for our purposes. Less than $30 dollars and you have a nice amp.

The idea of using Arduino is definitely possible. We already have the ability to read current frequency for each VFO. We would need to pass that reading into a simple if/then. It would just be a statement like "if freq < Xa and >Ya then filter_a = true" where Xa is an upper band limit and Xb is a lower band limit and filter_a is a relay trigger. Is it possible to have a command pass-thru though so that we could still have rig control with the external filter attached? My coding skills are still 1983 unfortunately, but I can limp through it using examples from existing code snippets. I was able to successfully make a fox-hunt box out of an Arduino Leonardo and a Baofeng uv3r this way.
I also had a chance to experiment with the extra DB9 pins that seem to be tied to the internal filters. I had thought they might be for triggering the internal filters manually, but I think they are there for triggering external filters in a PA. Yet another device that would need some sort of pass-thru. I'm hoping that this is how the 20 watt amp they were talking about would work.
I'm looking at the HardRock 50 project as a nice amp to use with the X1M at home. Has anyone else looked at this one?

The idea of using Arduino is definitely
possible. We

already have the ability to read current
frequency for
each

VFO. We would need to pass that reading into a
simple

if/then. It would just be a statement like
"if freq

< Xa and >Ya then filter_a = true"
where Xa is an

upper band limit and Xb is a lower band limit
and filter_a

is a relay trigger. Is it possible to have a
command

pass-thru though so that we could still have
rig control

with the external filter attached? My
coding skills

are still 1983 unfortunately, but I can limp
through it

using examples from existing code snippets. I
was able to

successfully make a fox-hunt box out of an
Arduino
Leonardo

and a Baofeng uv3r this way.

I also had a chance to experiment with the
extra

DB9 pins that seem to be tied to the internal
filters.

 I had thought they might be for
triggering the

internal filters manually, but I think they
are there for

triggering external filters in a PA. Yet
another

device that would need some sort of pass-thru.
 I'm

hoping that this is how the 20 watt amp they
were talking

about would work.

I'm looking at the HardRock 50 project as
a

nice amp to use with the X1M at home.

From: Charlie , W5COV
Topic: 2794 Message: 2824

Hi Mike ,

** I am only listing the ones that the X1M can cover right out of the box.**

We have the following ham and WARC ham bands not covered by internal filters in the X1M.

160 Meters
60 Meters
30 Meters
17 Meters
12 Meters

The Experimental bands , require either use under part 15 , or part 5 , and each band on part 15 has its own set of rules and are intended for license free operation , so power and antenna are heavily restricted, but still VERY useful .

Bands normally used as part 15 , but some may also be used with a part 5 license.

1750 Meters
AM Broadcast Band
22 Meters

Bands normally used as Part 5 Bands. Each license specifies the power, antenna , ERP. Some people have a kilowatt or more of input power allowed , but typically ERP is the limiting factor , but can be 25 or more watts.

4000 Meters (Not supported by the X1M since it is below 100 kHz.)
2200 Meters
1750 Meters
630/600 Meters

I am the moderator/owner of the Yahoo part15 group (no space between part and 15) When I am not enjoying the X1M, you will find me designing , building, operating , and / or listening to one or more of these bands. (I have had precious little time to devote to my hobby below 2 MHz. with the X1M changes, taking priority)
I have operated a part 15 , 1750 meter beacon for more than a decade now . There is a "watering hole" frequency for operators here in the USA. It is 185.300 kHz. Since we run such super narrow band modes , my frequency is 185.298.3 kHz. currently. I am using my old non frequency locked transmitter so I might be as low as .2 or as high as .4 We normally run QRSS60 in the beacon mode, but do experiment with most digital modes , even the ones hot off the keyboard , just a month or two old. My

beacon is QRSS60 and sends the ID of CV It is on the air 24/7.

I will try to make up a list later today with the frequencies to go with the meter numbers for the bands. Another site that is devoted to operation on part 15 and part 5 , with active station listings, is www.lwca.org

One last band that the X1M will cover with proper filters, but IS ILLEGAL to operate it on, is the CB band.

GA All,

I haven't seen anyone mention it but I sure could use a noise blanker / noise limiter on the X1M. I have intermittent power line noise and it sure would make copy a whole lot easier and nicer if the noise could be cut down to size or eliminated. Don't know if the AGC mod board could be used for part of it or not.

One other thing, since no one has said anything differently, I assume the instructions posted on the user's group for updating the firmware will work with the latest revision that we have to put in our new X1Ms.

One thing you might look into Dave are directional RX only antennas with a sequenced T/R relay (DX Engineering etc for the T/R relay). Even a small active loop can be positioned so its null is on the noise source.
Also MFJ's noise cancelling box which uses a sense antenna to subtract noise from the main antenna. NB's are very sophisticated, require sampling before any crystal filters and are well beyond the capabilities of our little X1M.
Finally, an audio DSP board like BHI etc can also do wonders.

Dale answered your noise question. We are really close to absolutely running out of memory, with all of the extra additions and upgrades that you now enjoy in the current PRO version with the latest November Firmware upgrade installed.MUCH MUCH more radio than any of us original purchasers expected. Personally I don't think there is ANY radio ANYWHERE that can compete with this assembled, 5 watt, SSB/CW radio anywhere for price, performance, and features !!! Plus this is an EXCELLENT support group.

I HIGHLY recommend that you order a USB cable from Ed, www.importcommunications.com . As you can see if you look at the history of the radio in the archives , you will see that the company has been ABSOLUTELY EXCELLENT about adding firmware upgrades to keep your X1M up to date to resolve any issues that we only find now on rare occasions. So if you want your firmware to be up to date ALWAYS, you WILL need the cable or an equivalent. I would caution you , especially the new owners it is VERY DIFFICULT to cut corners and try to buy something cheap or on eBay and get it to work correctly !!! Don't take a chance on something that "says" it is USB to TTL, but just go ahead and buy the cable from Ed. It will save you a LOT of headaches in the long run and you KNOW you have the CORRECT cable !!!

The instructions remain the same for doing the upgrade . I will look it over again and make any changes that might look better and make sure it is as simple as possible. I wrote it quite a while back.

If anyone does encounter any problems, you can always post to the group.

Subject: Re: [X1M_QRP-Transceiver] Additional LPF auto switching questions

Hey Ian,

You must be back from your trip. Hope it was a great one, and I know that it was well deserved.

The "S" meter idea as far as I know , did not make it further than the discussion phase . Dale was going to see if it was possible to use one fourth of the AGC chip possibly for it, but it did not appear to be too easily accomplished , but when it really got dropped , was when Dale decided to use a different chip and there was then no electronics to start the chain.

It is always possible to do it, but more people need to be involved in actually designing , building, and testing, all of the proposed mods . Dale especially with his great RF and radio electronics knowledge, also has a full time company to run, so he actually loses money when he works on X1M projects . I too build projects and kits plus other items for people, plus my electronics knowledge is in the industrial field. I am a retired Instrument and Control Engineer , for power plants.

Plus I suffer from a brain injury so I have to ask some more questions to fill in some electronics theory "holes" that I may or may not have once known prior to my injury. So our engineering time is "free," to X1M users when we have the spare time and ability. Dale and I "adopted" the X1M, because we could see so much potential in it , but it just wasn't being brought out. So it is a true labor of love , ANYTHING that we do for the X1M and we make NO money off of any X1M radio, device , or accessory. We sell any kits just at parts and shipping cost. ALL of the engineering and our ordering boards and parts, plus shipping materials come out of our own pockets right up front.

Everyone has a special set of skills and can probably contribute in some manner or method, an accessory for the X1M. If you don't have a breadboard , I would recommend buying one. They are great fun and make it easy to experiment with. Many parts today are so cheap that one can let the good smoke along the way and usually not lose very much money. I let the smoke out of several IRF510's when I first started learning how to build MOSFET power amps.

Since we have a nice influx of new users , perhaps someone else will take up work on the "S" meter circuit.

Dale is currently working on a CW Crystal filter that will fit inside of the radio. I am just getting the parts ordered and am preparing to do some work on the external filter board , to try and give Dale some more time.

Just jump in and do a little building and make a few mistakes on a breadboard and when you are done share it with the group and we will all benefit from it. There is room for everyone !!!

2833. Possible 9mc IF leakage

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-12 04:10:28 UTC
From: <pal350@...>
Topic: 2833 Message: 2833

Ran the new X1M all day today, probably twelve hours straight. Listened on many freeks, both inside and outside the filtered ham bands. No trouble for the first 8 hours or so. When operating correctly, the receiver is very good and useable. Could use some AGC, but that's being taken care of. :)

But about 8 hours in I started noticing a constant tone in the background, very faint. At first I figured it was just a BC carrier or other sig on the freek I was monitoring. But tuning around, I realized it was present everywhere when listening outside the filtered bands. It got more and more noticeable as time went on. There is no question it was NOT present during my intitial familiarization with the unit.

I'd like other users to run their sets for an extended time and see if they can duplicate my results below.

If I tune to 9000.000 MHz in USB mode I get the 9 meg I.F. sig very strongly (to be expected and not a problem). When I tune away, the persistent background tone is exactly the same frequency.

On 9.000.000 Mhz if I switch to LSB, the frequency of the demodulated 9mc IF sig goes up. If I then tune through the HF band outside the filtered range, the background tone mentioned earlier is the same higher frequency.

On 9.000.000 Mhz if I switch to CW, the frequency of the demodulated 9mc IF sig goes down (below what it was on USB). If I then tune through the HF band outside the filtered range, the background tone is the same lower frequency.

Ahhh, I said, we may have the old 9mc leakage issue again...

Further clues, present in all modes:

1) The tone varies subtly with the noise level. More noise, tone comes up.

2) The tone disappears when the antenna is disconnected.

3) The tone disappears in the filtered ranges.

I'm theorizing the following is happening anywhere in the unfiltered range:

The 9mc IF oscillator is present all the time, as evidenced when you tune right to it. On the FILTERED ham bands the low pass filters are good enough to catch it. On the UNFILTERED parts of the HF band, the signal-plus-9MHz (or signal-minus-9MHz, depending on how the mixing is handled) comes back in the front end and is demodulated to give the ever-present tone.

I absolutely know the radio was not doing this for the first 18 or so total hours of use. I would've picked it up immediately. This is something new.

Next, I cooled the radio down and checked again. No change.

I've ordered a cable and will upgrade to the Nov firmware. Hope that will solve the CW-first-element-dropout issue, but I don't think the tone issue is firmware-related...

Can anyone else reproduce this?

I'd also be interested to see if anyone is losing part or all of the first dit or dah sent out of receive mode like I'm experiencing. Mention what firmware version you're running since the newest one may fix it.

I have built two HF amps based on the 2009 QST homebrew challenge winner. It
uses two 98 cent switching transistors. With less than 2 watt drive it
outputs 60 watts on 20 meters. The output varies on the other bands with the
least output on 10 meters.
This amp is an easy inexpensive build and works well as a QRP amplifier. I
also adapted an Ebay Kenwood switchable low pass filter board on the output
of the amp.
I can't recommend this amp strong enough for our purposes. Less than $30
dollars and you have a nice amp.

The idea of using Arduino is definitely possible. We
already have the ability to read current frequency for each
VFO. We would need to pass that reading into a simple
if/then. It would just be a statement like "if freq

< Xa and >Ya then filter_a = true" where Xa is an
upper band limit and Xb is a lower band limit and filter_a
is a relay trigger. Is it possible to have a command
pass-thru though so that we could still have rig control
with the external filter attached? My coding skills
are still 1983 unfortunately, but I can limp through it
using examples from existing code snippets. I was able to
successfully make a fox-hunt box out of an Arduino Leonardo
and a Baofeng uv3r this way.
I also had a chance to experiment with the extra
DB9 pins that seem to be tied to the internal filters.
I had thought they might be for triggering the
internal filters manually, but I think they are there for
triggering external filters in a PA. Yet another
device that would need some sort of pass-thru. I'm
hoping that this is how the 20 watt amp they were talking
about would work.
I'm looking at the HardRock 50 project as a
nice amp to use with the X1M at home. Has anyone else
looked at this one?

Hi Mark,

I don't have the new radio... I just finished my 'kit' that was from back in the May time frame (I think).

Anyhow, a couple of thoughts.

1. Check it again at about the same time tomorrow & see if you have the same issue... maybe it's late afternoon & night time propagation getting into the radio.

2. Do you see it with the PRE turned off? (I don't hear it then).

3. I hooked up the rig to my spectrum analyzer, and any frequency that wasn't
in the filter network (say 30 meters, 7.3 mHz, etc) showed a multitude of
spurs & other noise. If these spurs & other noise were fed into the mixer, you would hear nothing but a roar of noise (like what we are hearing).
I'm not so sure that it's 9mHz blowby, but a demodulation of many many signals because of the trashy signals going into the mixer.

4. If you look at the schematics (in both the original and the Platinum), you will
see 6 band pass filters. The bottom one you can see has no tuned circuits
(in a bandpass configuration, just a Pi-type low pass filter). Since I don't see any
values for the capacitors, it's difficult to figure out what the cut off frequency
is. I figure that this is the filter that is inserted whenever in the SWL mode (or
those frequencies that aren't covered by the 5 bands.

Just food for thought - the next time I get into the box, I will take some analyzer
pix of what's going into the mixer from the DDS & see where the trash is coming
from in the TX chain. That should tell some tales. It's certainly possible that my
radio is different... it would be nice for someone else to do the same so we could
compare notes.

We could rule out 9mHz blowby by tuning the radio say to 4.5 mHz, and putting a

low pass filter in it that's got a 5mHz cutoff... should cut down on the
9mhz.
Probably could do the same to some degree with a manual antenna tuner.

But... it's a really cool radio!! :-)

GM Dale and Charlie,

Thanks for your replies.

I know that full blown fancy NBers take a bunch of hardware, etc. but I have seen circuits (NB and NR) in the past that were pretty simple and while not 'perfect' did serve the a useful function of helping to reduce impulse and power line noise.

Years ago I had a Heathkit SB-110A. I found a circuit somewhere that used 2 tubes with no fancy filters or pulse shaping circuits that did a pretty respectable job on such noise. I have seen circuits that were almost as simple as two diodes in opposition to each other with a few other components. Granted the better circuits do work better, but they all worked better than no NB or NR. :-)

The only time that I have seen where "NB" or "ANR" made things worse was in the IC-718!!! My power line noise just ate that RX alive. I think my X1M without any NB or NR probably copies signals better than the IC-718 did with its "NB" or "ANR" turned on.

Anyway, FWIW.

From: <disklog@...>
Topic: 2839 Message: 2839

I noticed today two manufacturing issues with my new X1MPro. I am not sure I will be able to use the radio because of these problems.
1. On the front panel they spelled "Transceiver" wrong.
2. On the back panel they spelled "Headphone" wrong.

These glaring issues will make this radio difficult or impossible to use. Woe is me.

Luckily, we do not have the writing in Chinese Characters.....

We have posted a new version of the User's Guide this morning. New stuff:

1. Firmware update procedure. Edited Heath's instructions.
2. How to kludge up a programming cable. Nice diagram from Ed.
3. New screen shots and updated option explanations.
4. Shots of internal options.
5. Corrected some typos -- hard to proofread our own stuff!

A Merry Christmas to all, and enjoy your new radios!

Hi Ken,
You can bring out the voltage from Pin 5 of the MC1350 and use a couple of op amps to first zero the voltage at no signal and then scale it for the S meter sensitivity. I would have done this on the AGC board but ran out of op amp stages and room. Since the S meter would be external anyway, it makes sense to do the math outside also.

I have to go to the P.O. on Thursday or Friday- easy enough for me to drop a replacement AGC op amp in the mail to you. Just resend your USPS address.

LOL Steve I have known you for years and know that if it is a small brain that you have, it is completely stuffed with out of the box electronics thinking, design and building !!

We are really fortunate to have you join so much other talent that we have on this group. This radio IS the radio to own when you get all the guys that I know on here working on it. May not happen today or tomorrow, but you can be assured if there is any way possible to accomplish whatever you want for this radio, we have the people on board that can do it.

I just ask everyone be a little patient , because this is still a hobby to most people on here and they have family and jobs that have to come first.

THANKS Paul !! Your work is very much appreciated !!

For the new members, Paul is our X1M "author" . PLEASE take the time to
read the manual once it is posted. I read it again just yesterday.

If you find something that needs added or changed, please let Paul know.

2848. AGC KITS

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-12 21:37:28 UTC
From: Charlie , W5COV
Topic: 2848 Message: 2848

Most of you know , but for the new members that may not know , Dale, W4OP,designed and spent many hours of development to provide a surface mount AGC kit that will fit INSIDE of the X1M. He did ALL of the work and deserves 100% of the credit for it. It is a very nice addition to the X1M.

BE WARNED IT IS TINY !!

To give Dale more time to work on design and development of a Crystal CW Filter board to also go INSIDE of the X1M , I will be kitting up the AGC kits for those that want to add one to their radio.

I will not post them ready for sale or ready to take orders until ALL parts are in hand. No selling of something that I don't have in hand, that way I can keep track and provide you as quick of service as possible.

The price for this batch of kits , including shipping is slightly higher as I only order when we are ready to put kit batches together, so we pay market price for the parts at the time of the order.

US COMPLETE KITS $12.00
DX COMPLETE KITS $14.00

This INCLUDES shipping charge

PLEASE wait until I post them as available, before ordering them, and I can take check or PayPal at that time. The anticipated date of availability is Monday.

Don't forget to check Dale's antenna and electronics page, when you are in the market for the type of equipment that his company manufactures. I for one would tell you to check out his omniangles antennas !! Great performer , horizontal omni directional, no rotor needed !!

2851. X1M EXPERIMENTERS

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-12 22:17:51 UTC
From: Charlie , W5COV
Topic: 2851 Message: 2851

The X1M is a great little radio to design , experiment , and build accessories for. Even if you have little or no background in electronics, but have an idea, have a look at some of the QRP especially books on building that are out there . Many people with no background in electronics at all will be surprised with many of the modern components available for things like developing an "S" meter circuit. Another would be a simple RF indicator that will fit inside of the radio and give you a visual indication of RF out without having to watch the display. It wouldn't in its most simple form, tell you power, but if you want to work a little more that could be accomplished too.

Things don't have to be overly complicated. In fact simpler is better in a lot of cases. If you have questions on your idea or design, post them to the group. We have some really well known long time designers on this group.

I have built single band filters to add to mine and am working with Dale's help on a multi band filter board. Probably 5 bands. However he is tied up with the Crystal CW Filter to put inside of the X1M and I am just trying to get a little head start on what will probably be his next project. Dale is a very nice guy and devotes a LOT of his personal time and equipment to design mods and additions, which takes time away from his full time electronics business. He is the brains behind most of the electronics design behind most of the ideas :) I am just good at building and testing and have more free time than he does.

I also keep a fairly decent stock of parts on hand, since I do a lot of building and experimenting below 2MHz. So if you happen to need a part and don't need to make a full order of parts, drop me a line and if I have spares, which I likely do, I will drop them in an envelope to you. If you have a chance pick you up a breadboard,even off of eBay, you will be surprised at how much you will use it and what you can build. Also order a power supply. They have some that plug right on the board and provide you with 12 volts and 5 volts, or there are other models that do +/- and some from 3.3 to 15 volts. You will be amazed how much fun you can get and spend less than $10 on eBay !!

You can easily build several different small antenna tuners to use with the X1M. LOTS of useful accessories out there just waiting for you to build and most important don't be afraid , in fact , PLEASE DO share your projects with other members !!!

You can build a power supply exclusively for your X1M , or a power amplifier. You have one of the best engineering support groups, especially for QRP here , that you will find ANYWHERE !!

Here is a site that will give you tons of simple , but useful projects,
that you can easily breadboard, if you need any ideas.
http://www.techlib.com , be sure and check the "circuits" box at the
top of the page for more projects.

Have fun and PLEASE share !!

Charlie , W5COV

2852. 10 METER CONTEST

Yahoo group: X1M_QRP-Transceiver (2013)

From: Charlie , W5COV
Topic: 2852 Message: 2852

If you really want to give the X1M a good workout and hopefully we will see MANY X1M to X1M contacts made , then get on 10 meters this weekend. LOTS of fun if the band is in good condition as it has been pretty much for the past month.

If someone has a suggested frequency that includes all license classes , we could maybe go to it on the hour or better yet, the half hour and see how many X1M group members that we can work !!

Hope to see you on 10 !!

The 2013 ARRL 10 Meter Contest <http://www.arrl.org/10-meter> starts at 0000 UTC on Saturday, December 14, and runs through 2359 UTC on Sunday, December 15.

Hi Charlie,
Dale has agreed to send one to me, so thank you but I will look for his in the mail.
As far as the S Meter chip is concerned, I will not be using surface mount. Since the meter will be attached outside the radio, I will have room for a small through hole circuit.
A watt meter and SWR attachment could be incorporated into the same configuration, but I will have to ponder the mechanics of that design/connection.
Ordinarily I would install a small torrid pickup for the power/swr at the antenna jack inside the radio. When I changed out my final transistor, I saw that there is zero room at the antenna jack. We shall see how it goes.

I hope this isn't a repost but I haven't seen it before. The latest version Pro does not have a gain bias pot for the MC1350 I.F. chip. They have eliminated the pot and established bias with two surface mount resistors. I failed to note those resistor values when I had the radio open but will document them next chance I get.
This all is of little importance to those that have installed the AGC board, but it may help eliminate confusion to someone that is looking at an older version photo while modifying their radio.

Topic: 2856 Message: 2859

Any chance of someone taking a picture of at least the top of the top board on this new run, and if anyone takes their rig apart to do the final transistor mod , I would certainly be interested in top and bottom pictures of both boards if possible.

Dale and I have radios from the last production run, so it would be of great use to be able to see the changes made to the components on this run.

Perhaps now that it has been shipped we can also get a current schematic of it.

Thanks ,

Charlie , W5COV

Dale,
I have a question for you.....
You said maximum gain for the 1350 was 4.17v. Did you notice much difference in reception between the factory gain setting, and your 4.17 maximum?
Ken

2862. Re: [X1M_QRP-Transceiver] Main Schematic Change

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-13 04:05:34 UTC
From: Dale Parfitt
Topic: 2856 Message: 2862

Max gain is anywhere from 0 volts up to the kneee in the AGC curve. This used to be at 5VDC. The 1350's being made today (offshore?) seem to top out at around 4VDC. 4.17VDC is where we normally set the AGC to start kicking in. On my receiver, that corresponded to an input signal of -90dBmV. Others may wish the AGC to cut in at a lower or higher input level.

2868. Re: [X1M_QRP-Transceiver] QRP Antenna Tuner kit

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-13 14:36:15 UTC
From: Bastress, David G
Topic: 2863 Message: 2868

To The Authors on the new manual:

Thanks gang, very nice work!

I do have a suggestion though. On page 8 you have a partial shot of the top board and you have a section entitled "Setting the Side tone". In step 4 you talk about the "left hand trim pot" adjusting the side tone level.

There is no mention of what the right hand pot does anywhere that I saw. (Maybe I missed it) It should also be mentioned somewhere as it adjusts the microphone level and may need to be adjusted from time to time.

Also (it would be nice but not absolutely necessary) how about adding arrows to the pots in question and labeling them. There is an earlier picture on the site somewhere where that was done but it is for an earlier version of the board.

Again gang, thanks for the excellent work. :-)

As some of you know, the factory misspelled "Transceiver" on the front of this latest batch of radios. The factory is sending corrected faceplates panels to me sometime soon. When they arrive, I will forward one to each customer that has a misprinted one. The rear panel has "Headphone" misspelled. (I don't know why they changed that from SPK) I'm not asking them to replace these so I hope everyone can live with it.

Also, I would appreciate any good reviews you would like to post on the various equipment review sites, like eham and QRZ. If you can't give it a good review, forget that I asked ;-)

2872. RE: QRP Antenna Tuner kit and more on possible 9mc IF leakage

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-13 17:26:21 UTC
From: <pal350@...>
Topic: 2863 Message: 2872

That tuner uses N7VE's well-known LED SWR circuit. In the TUNE position an absorptive bridge is used which presents 50-ohm load to your radio while also matching the xmitter to the antenna, which forms another leg of the bridge. Another bridge leg, the LED, is tuned for minimum brightess. Very slick.

I built the original Mahattan-style NORCAL BLT (Balanced Line Tuner) years ago and take it everywhere. At that time you had to solder the box together yourself out of copper-clad board and glue down the component pads, but the design has been updated since:

http://www.qrpkits.com/blt_plus.html

Pros of the BLT are that it has a more sophisticated output arrangement that allows matching more impedances. The original BLT required me to add parts to tune both balanced and unbalanced lines, but the new version includes those parts.

Cons: neither BLT version will handle 80m. I found mine will in SOME cases.

I wonder if that Chinese version will really handle freeks below 40m.

~*~

On the spurious tone business, it looks like what I'm seeing is at least partly antenna and propo-related. The tone is present across the HF band only when the Sun is down, and is much stronger on the 40m dipole and B&W broadband AC-1.8-30 end-fed inverted vee. The former has a balun and the latter a matching network. The 20m and 80m dipoles, which both have baluns, seem to be much less affected.

The tone goes away when any antenna is disconnected.
The tone is the same frequency as the one you get when you tune directly to 9.000.000 MHz and whatever mode.
Hooking up the BLT between the X1M and the 40m antenna knocks out the tone almost completely.

So the X1M RX is clearly responding somehow to a signal making its way into the set. Speculation: that mechanism could be the mixing product (9Mhz plus or minus incoming signal) in the set leaking up the antenna, then bouncing back to get re-demodulated leaving a single audio tone product that's present everywhere.

Stuff like that has happened before. I seem to remember the Navy had trouble with their R-1051 receivers. Signals from nearby high-power transmitters would rattle around in the R-1051 front end inductors and get re-radiated, causing havoc.

Another thing to check here is if there's a really strong BC station right around 9 MHz. Also, 7 MHz is my closest antenna to 9 MHz, and the B&W is very broadband by design.

This is what makes this hobby interesting...in the Chinese sense, that is.

As some of you know, the factory misspelled
"Transceiver" on the front of this latest batch of
radios. The factory is sending corrected faceplates
panels to me sometime soon. When they arrive, I will
forward one to each customer that has a misprinted
one. The rear panel has "Headphone"
misspelled. (I don't know why they changed that
from SPK) I'm not asking them to replace
these so I hope everyone can live with it.

Also, I would appreciate any good reviews you would like to
post on the various equipment review sites, like eham and
QRZ. If you can't give it a good review, forget
that I asked ;-)

2875. Spectrum Photos Uploaded

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-13 18:24:41 UTC
From: Tim
Topic: 2841 Message: 2875

Hi Folks,

I plugged my X1M into my HP 8924C service monitor last night, and took some pictures of different things.

I have uploaded them into the 'PHOTOS' area.

Here's what they are, with a little additional information:

BTW, The center of the display is the desired frequency. Anything else displayed is either a harmonic, or some other trash in the signal.

1. *18_3_KEYDOWN* - This is a CW keydown while the frequency is 18.3 mHz. Undesired signals only 30dB down from the fundamental.

2. *7_3_SSB_NO_AUDIO* - As it says, 7.3mHz, LSB, with Keydown, and no audio. Really bad stuff there! (only the right hand spur)

3. *18_2_SSB_NO_AUDIO* - Similar to #2, but at 18.2mHz.

4. *18_3_KeyUP* - This picture is what you see after you let up on the key, before it comes back to receive. Note large out of band spurs. This is typical of what you see when tuned to an *out of spec frequency* after keyup.

5. *10_0_KEYDOWN* - This is CW keydown with the VFO at 10.0 mhz. Note all of the 'bad' stuff. _DO NOT USE ON 30 METERS_!!!!

6. *6_99_KEYDOWN* - Also a 40 meter version of #5. Don't use out of band! (on the PRO, without any firmware mods, this is what you will see above 7.15 & 3.899).

7. *18_2_SSB WHISTLE* - SSB Whistling into the microphone. The large signal is the desired one.

Now, having published this, I need to emphasize that the X1M's spectrum looks very nice within the published frequency limits.
This in no ways diminishes the nice design that the Chinese group did.
It just gives you a little more information of how much you can push the limits of the box with the integrated bandpass and low pass filtering.

YMMV! :-)

Today I added my review to the others on Eham but I don't see it. Maybe it will appear later??

Also, one review mentions adding a heatsink onto the AD9351 chip. Is this addition still necessary? I believe that review was for the earlier model.

Ken, I saw that some people were adding a penny to the top of the AD9351, when I first ordered my radio. It runs within the limits specified in the datasheet. I have never experienced any stability problems with my radio cover on or cover off.I have run for an entire weekend copying a narrow mode QRSS60 and had no problems at all.

I don't know there ever was an actual problem. If there was it must have been in the kit version because I have put continuous days of operation on both an original X1M and an X1M PRO from the last shipment and have not experienced any heat or other issues from continuous operation.

If anything runs a bit warmer than projects that I have built, it is the 9 volt regulator, but not enough to cause any problems.

Just my own personal experience. Others may indeed be able to explain putting the penny on it for a heat sink.

From: Tim
Topic: 2841 Message: 2878

Since I had the analyzer/sig gen out, I thought I would dig a bit deeper into the 'noise' that we all seem to hear whenever operating out of band.

I set the signal generator at 9mHz, and when operating out of band (any non-specified frequency), the signal went right through the box, and out the speakers!

So, the noise that we are hearing is because of signals in the 9mHz range.

I think that a 9mHz notch in the receive line may help - might play with that a bit later this weekend.

FYI

Charlie,

I am lead to believe,though not through personal experience that a heatsink might help improve stability.... See the last paragraph of this interesting read
http://www.knology.net/~gmarcus/WSPR/Aruino%20Mega%20AD9851%20v3.pdf

I suspect that the heat generated by the DDS is affecting the frequency of the crystal oscillator which determins the frequency of the DDS. However as i do not have my XM1 yet I cant test this. One way of compensating for this is by using a correction factor in firmware but i suspect this would be different for each radio. It would be interesting if anyone with the right test gear could measure the ddrift over time with, and without a heatsink. And with some thermal barrier in the way...

2883. 9mHz Receive Trap

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-13 22:27:45 UTC
From: Tim
Topic: 2863 Message: 2883

I did some snooping in the schematics, and found a place to insert the trap that is really extremely easy to do!

The trap is placed on the jumper board that goes between the top and bottom boards.

1. Remove the front panel carefully (actually, only the top 2 connectors need to be disconnected).

2. Separate the top board from the bottom.

3. Take out the jumper board from the back of the radio near the Antenna connector.
NOTE THE ORIENTATION - MAKE A DOT ON THE OUTSIDE EDGE.
If you insert it incorrectly, the radio won't work, and it'll draw about 1.75 Amps.
(ask me how I know) :-o

4. Looking at the two pictures, cut the traces on BOTH sides of the board. I use an XACTO knife.

5. On the side of the board that has the connectors soldered (the component side of the board),
Scrape some of the solder mask from both sides of the cut (you will be soldering some parts
to the bare copper).

6. Get a 3.9uH inductor and a 100pF capacitor, and place them in parallel across the cut on the PCB.

7. Re-assemble the radio (noting the position of the connector. Don't forget about the 5 pin connector
in the middle of the board when you place the boards together. Be careful of the 2 connectors on the
display board as you bring the boards together. Make sure all pins are aligned.

That's all there is to it.

Now, the amount of 9mHz signal needed to be heard by the radio has been attenuated by quite a lot.
You should not hear the 'roar' with the preamp on in the non-spec'd portions of the spectrum. (outside of
the 5 ham bands).

I did not notice any significant attenuation of any received frequencies, even in the 10mHz band. You should
however notice some attenuation at 9mHz!!

If you ever want to restore the unit back to the way it was, merely remove the components, and place a jumper
across the cuts on both sides of the board.

NOTE: This modification will probably void your warranty. Also, it does nothing to mitigate the spurs/noise in the
non-specified transmit frequencies (outside of the 5 bands).

I noted no reduction in power on any band with this modification.

YMMV

2884. Operating Voltage

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-14 02:45:55 UTC
From: <disklog@...>
Topic: 2884 Message: 2884

I have read reviews that mention poor or no operation below 11.6 volts.
I did some tests with my latest version Pro and my radio works well from 9.6 volts up to the highest I wanted to test at 14.0 volts.
The receiver seems to work fine anywhere in that range, the transmitter power output drops in sync with the reducing voltage.
This is useful to know for portable battery operation, and if one wishes to reduce power to safely drive an amp, all that needs to be done is reduce the supply voltage to the desired drive level. A cheap and dirty way to reduce voltage is a string of 3 amp diodes in series. One can jump (or not jump) whatever number of diodes to obtain the desired voltage output.

2886. Suggestion on filter selection

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-14 03:01:19 UTC
From: <pal350@...>
Topic: 2886 Message: 2886

Thanks to Tim for the 9 MHz trap fix.

I was thinking something else to try would be to mod the firmware to
cut in the closest low pass filters depending on wherever you are. This
assumes the low pass filters are truely low pass and will pass anything
below the F0.

3.9 MHz cutoff filter
selected 100 KHz - 4.000.000 MHz
(If it really is sharp enough to start cutting off at 3.900 MHz, then
developers should think about tweaking it for an F0 of 4.000 MHz)

7.15 MHz cutoff filter
selected 4.000.001 - 7.300.000 MHz
(If it really is sharp enough to start cutting off at 7.150 MHz, the
developers should think about tweaking it for an F0 of 7.300 MHz)

14.4 MHz cutoff filter
selected 7.301.000 - 14.400.000 MHz

21.45 MHz cutoff filter
selected 14.450.001 - 21.450.000 MHz
(20m actually goes to 14.350 fo us)

29.7 MHz cutoff filter
selected 21..450.001 - 29.700.000 MHz
or 21..450.001 - 30.000.000 if the filter isn't so sharp it cuts into
that last 300 KHz.

Charlie, this should not take additional extra PROM space because only the filter selection frequency values will change. This would not affect current filter functionality for the ham bands, and may or may not help transmit filtering outside them. It also may or may not help the 9 MHz "bleed-in" situation in receive mode.

Hi Mark,

Now that it's a bit later in the evening, it seems that the filter might need a couple of more poles!!

Certainly the LC helps, but it could be better - Back to the drawing board, but there
seems to be a good amount of space to work with on the extender board.

More later in the weekend.

2898. RE: Quick Thank You!

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-14 22:00:42 UTC
From: <deadgoose@...>
Topic: 2894 Message: 2898

I'd be please to address the CW issue in the User's Guide if somebody would write up a SIMPLE explanation of what to do/not to do. Two-three paragraphs, at most.

Is Dale's material in the prior message sufficient?

I think the problem that I have is that if I can hear them, and they are calling me, they can work me. We have been spoiled by DDS systems that allow us to zero beat the incoming signal...

ALSO, do we REALLY need three (potentially confusing) discussions on system alignment?? I'd love to cut it down to one. Generally, in a teaching situation, having more than ONE explanation (no matter how good the others are) simply serves to confuse the new user. Which ONE should we keep??

Inquiring minds want to know... <grin>

Remember, a camel is a mouse developed by a committee...

From: Charlie , W5COV
Topic: 2900 Message: 2900

THIS IS OFF TOPIC SO PLEASE DELETE , IF YOU WISH.

Topic : Web Page Design

I am 60 years old and unfortunately have suffered a brain injury, along with other medical issues, and regularly take a narcotic pain medication.

I have absolute complete holes in my memory related to computer and electronics knowledge that I once was highly proficient in. I also have short term memory issues, at times quite severe.

At one time I had several web pages that I wrote and maintained and would like to once again have at least one web page . However I am in need of some information on what is the best "guide" out there to allow me to build my own page once again. I still have pieces of memory intact, that I do remember a lot of HTML programming and the use of the commands. My big loss is actually on getting started and the index page. It might be "possible" for me to continue to expand and add pages to it as I need.

It will be radio and electronics related. I still do a lot of design and building of prototypes and "one offs" of projects mainly for the frequencies below 2MHz. I would like to share some of these projects with others. Also some "accessories" that could be used with the X1M and other QRP radios and equipment.

Also I want to include at least one page for my tiny labor of love radio , the X1M. Some thoughts, ideas, hints and kinks, and some general discussions that aren't a good fit for this group, until they are advanced and polished up some more.

I am on a fixed income and don't have a lot of spare money to hire someone to do a page for me, plus I would like to be able to once again do it myself.

Also perhaps a little later down the line, a person or link to becoming proficient with ExpressPCB in a step by step manner, to design and offer boards for some of my projects, that I think others might find of interest.

I do all of my projects on perf board and use point to point wiring, but many people want a board, and it does make it much easier for everyone, especially beginners and newbies.

Any information will be greatly appreciated. Please feel free to contact me off list at my regular e-mail address: cvestATcox.net

Thank you,

Charlie , W5COV

Charlie,

You really don't need to know HTML any more to make a nice website...there are quite a few free services which have pre designed templates....

Take a look at :-

http://www.wix.com

http://www.weebly.com

or google "free website builder"

Also Google havs something as well.

A lot of PCB design tools are free, some do stripboard and plug in breadboard as well. Check out :-

www.fritzing.org

http://www.cadsoftusa.com (eagle) Jeremy Blum has some excellent tutorials on UTube...

http://www.designspark.com/eng/page/designspark-pcb-home-page

I think the thing it to choose one and stick to it. They all have pros and cons...

2902. 10 METER CONTEST

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-16 06:41:04 UTC
From: Charlie , W5COV
Topic: 2852 Message: 2902

Just curious how many people were on for the contest and how everyone did.

I have been reading some posts on other groups and it appears that there was a LOT of activity !!

Some nice totals posted by the serious QRP guys. Everyone in the states that I have read so far, said European contacts were plentiful.

You NEVER know if your state is going to be the one that ends up being the one most needed by people trying for a clean sweep of states or sections. Last month it was Arkansas. This contest, it appear that South Carolina, was the state most people ended up being short of contacts with .

These contests can make you like a DX pile up, if you happen to be one of the top states everyone is looking for. I wish they would publish a summary of the top 5 or even 10 least worked states/sections for each contest.

I can't pull the long hours like I used to for contests , and these days I mainly do hunt and pounce, since I reset my log to zero. I haven't made a full force contest effort for a few years now, but I still try to operate and give out a few points and try to add a few stations that I need as I slowly, VERY SLOWLY work my way back to WAS, DXCC,etc., on different modes on all of the bands, 160 through 432 .

I live in Oklahoma, but I am just about 1/2 mile south of the Kansas state line. Always a tough call for me to decide which state to operate from. The radio club that I belong to owns it own building on top of the highest hill in the immediate area , with a club station, that is always available to members. It is located in Kansas.

I did see a report from one of the "REALLY BIG GUNS", that had an Alpha amplifier and a SteppIR at 75 feet, can't remember how many elements, but it was one of their bigger antennas.(I can't even go to a page to look at their most basic antenna, I am afraid that there would be a charge for that also :) He ended up needing S.C. too !! However he had exactly 100 countries, so if he didn't already have it, he got DXCC on 10 meters in one weekend !!

So even the BIG GUNS would have been VERY happy to have heard an X1M from S.C. !!

I think there is a 160 meter contest coming up again in January. Might give you plenty of time to think about and get on 160 for it. I will likely run a lot of QRO at 100 watts during that one, since I need LOTS of states,etc. on that band and that is getting right on through the winter, where I have the best chance of adding some of them.

Keep those X1M's on and lets show everyone what they will do !!!

Charlie, W5COV

2903. Re: 10 METER CONTEST

Topic: 2852 Message: 2903

Hi Charlie,

I worked 10 stations in just a few minutes. The band was open pretty good here in Southern IL. The X1M did a great job using my G5RV (Inverted-V) antenna and no amp. Got most stations on the first call. Had to work a couple of pileups but had no problem. I'm not a contester just wanted to see how the little rig would do on 10m in a contest situation. How about you, what was your experience?
Regards, Rick.

Unless you load the latest firmware, the first bit of the first element sent will be on the RX frequency and sound like a clipped character on the TX freq.

CW is 801 Hz under IF. This gives an 800 Hz tone in USB on the test receiver.

Tried setting CW = IF. That requires me to tune down 800 Hz in USB on the test receiver to get an 800 Hz tone.

Symptom persists. I don't think this has anything to do with how the CW BFO is set up.
I don't use CW a lot, but when I do it's usually with mil surplus friends who are using radios
that derive CW by injecting a tone into their xmitter's balanced modulator. When I say "meet on
7125", both of us tune to 7125.000 indicated and have at it. Usually our radios don't have a
separate CW mode switch setting - we just connect a key in USB mode. When the key is operated,

the radio injects an 800 Hz tone into the balanced modulator and that's what the guy on the other
end hears. No messing with RIT at either end, no chasing tails. That's why I set up my CW per the

top parameters.

But here it doesn't matter how I set up CW, off-set or down the center of the IF...still getting that
first character element cut off.

2907. Re: [X1M_QRP-Transceiver] ATTN - Ed and the Group: Initial thoughts on the new X1M version

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-17 04:22:25 UTC
From: <cvest@...>
Topic: 2767 Message: 2907

Mike I am not sure where in the change log, that we were able to get them to upgrade the clipping issue. If you upgrade to the latest firmware and the issue is not resolved , please let us know. I happen to have two X1M's on the bench at the present time, that I am working on for group members, so I am not in a position to be able to verify or attempt to duplicate the issue just at the present time.
I have been busy working on X1M's today and while I have my bench configured for that, I am going to continue on those. I also have to get kits ready to ship out tonight , so I am really just getting a start on my night too.
It is likely the earliest I can look in depth at the issue to see if it still exists with the latest upgrade, is tomorrow afternoon when I can get the radio over on the "high tech" test bench, versus just my test and repair bench.
Perhaps someone else with the latest firmware installed can give it a try and report on their findings.
I notice the earlier software/firmware upgrades are no longer on the web page, so I can't back one up to an earlier version to do a comparison.
The original problem was that it was not switching fast enough to the transmit mode on CW and the character was actually still being sent, however it was being sent on the receive frequency. If you have a spare receiver that you can listen on, try listening to your CW RECEIVE frequency and see if that is what you are experiencing.
Please check the manual too. It has a paragraph in it devoted to the correct way to set up the IF offset, and the tone for CW. The X1M should perform just like any other transceiver in the CW mode.

One thing also explained in the paragraph in the manual is that you must tune to the "low side" of the CW signal. It is much like using a Direct Conversion receiver in that respect, that there are two places that you can tune the signal.
We are attempting to work with the factory on this particular issue, but apparently the Chinese do not use CW or at least very often. It is a VERY TECHNICAL change issue to communicate to them, since they literally do not have anyone that is fluent in RF and ENGLISH. The issue itself is pretty straight forward and well known to anyone who uses CW and a DC and actually simple to us here , and easy to discuss and explain. However it becomes a VERY TECHNICAL issue in trying to put it in a form that they can get a firm grasp on.

GM All,

Anyone on here ever interfaced an Signal Link USB to an X1M? For some reason I am having difficulty getting it done.

I've gotten the PTT working after taking the case off the SLUSB and tracing the wires all the way through from the jumper socket in the SLUSB to the ring of the mic connector. It seems some wire colors were not what I thought they were!

I have done the same for the TX audio from the jumper socket in the SLUSB to the tip of the mic connector and yet when I key up the X1M by sending a signal from the computer through the SLUSB the X1M does key up but I have no signal out of the X1M. I have double checked and I have audio out of the SLUSB per my o'scope. So what am I missing?

Thanks.

A few days I asked once before

Hello,

A few days I asked once before:

Works with the last firmware update the SPLIT function correctly even in CW mode?

In the new User's Guide is that, this does not work.

Which is correct ? Who has experience ?

Hello Dale, Charlie, Group,

I was testing CW in the ARRL 10m Contest too.

So my antenna for 10m isn´t realy well but I´ve reached some US-Stations and other DX-Stations allways on the first call. So there cant be an issue cutting the first sign. Speed was abt. 25 – 35WPM using K1EL´s Winkey as external Keyer.

I checked this also with an cw-decoder (cwget) and all transmissions were decoded properly even the first sign(I´ll post some screenshots with different speed). The difference between TX- and RX-frequency is only 3 Hz!

So no more issue on CW-TX, but the recovery time TX à RX is a little long, for higher speed. I was somtimes missing the first letter of the DX-Station and I guess they were not using an X1M ;o)

Anyway a CW-filter would be very helpful, please put me on the list.

Now, with the new firmware, I´m a very satisfied X1M owner :o)

I'm thinking of ordering an X1M and Programming cable. The Import Communications shows the X1M Pro is in stock but the cable is out of stock. I send an email about availability and warrenty questions to info@importcommunications.com mailto:info@importcommunications.com but have not received an answer.

Does anyone know how I can contact them to get my questions answered?

Does anyone have the pinout for the programming cable? Can I modify a USB to RS-232 to use as a programming cable?

Thanks,

Mike N2MS

GA Dale,

I do have a couple of questions, etc. related to the settings.

The CW delay is default set to '300'. Three hundred what? Milliseconds?

The TXP TIM has up to 4 digits, of what units? tenths of seconds, seconds, minutes, etc.?

There seems to be no info available on them.

Last weekend after installing the new software had a CW contact with a friend. He didn't notice any first element shortening. Also I have looked at the CW signal with Spectran and didn't see any major first element shortening. If there was any shortening, it was less than 1/3 of the first element long.

Hi,

I use this cable:

http://www.newark.com/ftdi/ttl-232r-rpi/debug-cable-raspberry-pi-module/dp/28W2088?MER=PPSO_N_C_EverywhereElse_None

...

http://www.farnell.com/datasheets/1641076.pdf

cable SUB-DB9 (X1M)

Black (GND) Pin 5 (GND)

Orange (TXD) Pin 2 (RXD-TTL)

Yellow (RXD) Pin 3 (TXD-TTL)

Tested with HRD, N1MM and Firmwareupdate.

OK, you need FOUR wires from the SignaLink. Get an RJ-45 cable -- nice flexible one is best, and a 3.5 mm stereo plug. I chopped a 3' one in half.

Set up the jumpers in the SignaLink as you wish.... 2 grounds, PTT, and microphone.

Having picked 4 wires on the SignaLink RADIO jack (your choice -- I use my SignaLink also for my Alinco DX-SR8), strip them back, and connect the two GROUND wires to the sleeve. PTT goes to RING, microphone to TIP. Don't goop up the inside of the plug until you are sure everything works.

You ALSO need a male-mail 3.5 mm stereo jumper for the audio. This goes from the back of the X1M to the AUX connector.

Plug the SignaLink USB into your computer. Follow instruction in the SignaLink manual as to the settings for TX, RX, DLY, etc.

That is all there is to it.

Hi Ken,

THANK YOU !!

I certainly appreciate your taking the photos. For a while I lived with
a radio in pieces and no covers, but once we are finally getting it all
pulled together a photo is so much more handy than taking a radio apart :)

It is also a great way to see the boards in the new version. I have
radio examples of every version up to this version. However there have
been slight changes to each set of boards and I like to be able to
follow people and what they are trying to describe or talk about.

I do plan on doing a little heatsink work inside of my own personal X1M
, especially on the 9 volt regulator. Now that we have a stable radio
right out of the box, I am going to investigate some of the current
draws and heat issues. I even bought a couple of different regulators
with a higher current rating to play with.

This is a great group with people like you so willing to help everyone else.

Many thanks,

Charlie, W5COV

Dale,

You´re right.

The pitch is set to 700Hz. After tuning to a CW Signal peak the TX is transmitting on 703Hz. That was the difference I ment.

Ken, I had the same problem.

If you open your browser (for IE), click on Tools/Internet Options/Delete then make sure “Cookies” has a tick beside it, then click delete.

Close your browser and all should be OK when you try to access yahoo Groups again. I don’t know what they’ve done, but I had the same error and deleting cookies fixed it straight away.

Hey Rick,

I am running about an identical setup to yours. I have a G5RV that started out at 30 feet at the apex and is slowly getting a little lower :) I hope to get it switched over to the PVC pipe cross arm that I have coming out of the side of the tower at about the 50 foot level. Now then I can be a "big gun"<grin> Just really hard for me to accomplish alone and the weather, until yesterday and today has been down around zero at night and very cold during the day with a strong north wind.

I managed 35 contacts in just casual operating with the X1M , but 14 of those were with DX stations !! Most were worked on first call, some of the DX and even a couple of stateside stations required 2 or 3 calls. Never any long drawn out waits to make a contact.

For December on 10 meters, I thought I did quite well and had a lot of fun doing it !!

Good to see the X1M guys being active and having fun with this little radio. One day I am going to upgrade to one of Dale's Omniangle antennas for 10. It would have been perfect , omni directional horizontal and an antenna made for the band.

2946. 9 Band Low Pass Filter & Wattmeter Photos

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-18 02:39:38 UTC
From: <disklog@...>
Topic: 2946 Message: 2946

After many tries, the photos again uploaded.

This is my version of a switchable low pass filter unit and wattmeter. It can be used with any radio up to 100 watts.
The case is painted copper circuit board material, and the filter board is from a Kenwood 940 radio.
The wattmeter is an old meter with a homebrew scale. It is driven from the wattmeter circuitry already on the Kenwood board.
The main problem in using this board is the relays are 24 volts. I got around that by operating them from a gimmick circuit that stores power in a cap and adds that voltage to the 12v line. Once operated the relays are maintained with only 12vdc.
Makes the X1M and homebrew amps stay within FCC specs.

Ken, I saw the initial pictures of it and it looks very nice. I'll go have a look now. Another one of my projects, waiting to get further along on. Have some relays on order, that should be here in a day or two. Mine are 4.5 volt coils . Thought I might have a voltage converter here that would help you , but all I have run across so far are just 5 to 9 volt . Maybe a little more digging :) I have the watt meter under construction also.

2949. A little help 2nd try

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-18 03:16:16 UTC
From: <kk6wls@...>
Topic: 2949 Message: 2949

I started to do the firmware upgrade on my X1M Pro. Everything was going as planned until I absentmindedly pulled the power cord instead if shutting off the power. As I did the plug touched the case and low and behold smoke was let out of the rig.

I sat there beating my self up but figured I'd plug it back in and see what happens.
Rig powered up but no sound. I checked and still had the original firmware. So again why not...I installed the new firmware per the new manual, which seemed to process rather quickly (20 seconds). I checked the firmware and it indicated I had the new version. I powered the rig off and back on. No sound, but all else seems normal.
Well normal in that the dial lit up and sound started to work and then quit. I took the rig in the house and opened the case. From what I could see of the board nothing looked burned nor smelled burned. I again powered the rig up using a 12v AA battery pack setup. The rig powered and I had sound again for about 20 seconds then it quit. Now no matter what I do now, no sound either from the speaker or headphones. Is it a goner or do I have any hope of resurrecting it? Since I obviously don't have any testing equipment is there someone that I can send it to (Ed for instance) that might be able to repair my mistake? I did purchase it from Ed. ugh!!!

Thanks in advance,
Bill

Which run of the X1M PRO ? Is the LM-386 a DIP or SMD ? Could you tell the area of the rig that the smoke was coming from ? There are some basic tests in the audio section that you can do with a volt meter and a set of headphones.

Look at D7A, D8A, U2A and U1A. These are the first components that the input voltage sees. Page 5 of the PRO Schematic.
Also the Power Drop ckt- U6A as it does not appear to be protected by the reverse polarity diodes D7A and D8A.

Looks like Yahoo is rolling out some kind of change to the photo
section. I was just there and can't view some of the photo files.

They have Photomatic and Photostream , I could have missed them, but
this is the first time I remember paying attention to them.

2961. AGC KIT AVAILABLE

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-18 05:29:07 UTC
From: Charlie , W5COV
Topic: 2961 Message: 2961

The AGC , SMD , KIT , originally designed and produced to fit inside of the X1M , is once again in stock and I am now taking orders for it.

This is the AGC KIT designed and first offered by our leading X1M engineer on this group, Dale Parfitt , W4OP.

Dale is busy currently working on a crystal CW filter KIT , also an internal board for the X1M.

I am using the same boards and parts as what Dale included in his kit. You can check it out in the Photos and Files section of this group.

I am continuing to make them available, for those that have just purchased their radios, or people that may have missed out on the first run.

The cost , INCLUDING SHIPPING IS :

USA STATIONS $12.00
DX STATIONS $14.00

PAYMENT MAY BE MADE BY PayPal or by check . My mailing address is good on QRZ.

For PayPal, it is cvestATcox.net

Thank you,

Charlie , W5COV

From: Joseph Westbrook
Topic: 2963 Message: 2963

I have a stable (normally) working Win 7 PC. I bought the X1M Programming Cable and it doesn't seem to function very well. I purchased and I'm still awaiting the new "Pro" Panel. In the mean time, I've been using the XM1 with HRD and the performance is very poor. When attempting to change frequencies, HRD almost always hesitates which is really frustrating! Eventually after running for a few minutes, HRD will either lock up or the computer will "blue screen" because of this, I'm concerned about using this set up to update my firmware with my Win 7 PC. Is there anyone out there who have had similar issues? I have attempted various port settings including flow control, speed, etc. to no avail. Any input would be appreciated.

Thanks,
K7ZT, Joe

GM Joe,

I don't know if this will give you any insight or not. I bought the programming cable with the X1M.

My computer uses XP and I don't use HRD but I have tried rig / computer control running FLDIGI. With my setup, there seems to be a second or two delay between stimulus and response either way the command goes. (rig>computer or computer>rig) It seems like it may be an X1M thing more than a programing cable thing. :-)

From: Tim
Topic: 2886 Message: 2965

Hi folks,

I was thinking last night how it would be nice to be able to listen to AM stations with the lil' X1M.

But how? Well, so far I have found that I <always> need the preamp in to be able to bring things up to where I like to hear them. So, the preamp could be permanently enabled, thus 'freeing' up one of the control lines from the processor. (The AGC makes it ok as far as signal levels are concerned)

It doesn't take much to make an AM detector... I'm thinking a diode?!... Could use the MCU's now free I/O line to switch between detectors.

Food for thought... I'll ponder on it a bit more.

Fun for All!! :-)

Tim W5FN

Leaving the preamp on full time is not a good idea. The IP3 figure of the X1M will be degraded by the gain of the preamp. With my full sized antenas, having the preamp on for any frequency below 2MHz destroys the front end- all I hear is intermod and cross mod. This is good engineering practice for any of our HF rigs. If you need a preamp below 10MHz, there is likely something wrong with your front end.
The X1M AGC does nothing to help as it is controlling the stage post crystal filter.

As for AM, you can always use ECSSB- simply zerobeating the AM carrier. This also helps with selective fading as the opposite sideband is suppressed and thus not available for sideband cancellation. Whatever method you choose, the narrow crystal filter will be the ultimate limiting factor on how AM sounds.

2971. AGC Install on newest X1M's

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-18 20:05:54 UTC
From: <mikejmardis@...>
Topic: 2971 Message: 2971

I'm looking for some clarification on some issues before I install the AGC board on my newest batch delivery of X1M's.

I don't need to do the audio mod?

I still need to cut pin5 of the MC1350 IF Gain IC? There is no longer a pot adjacent to it on my radio (like in the pic)

I'm not sure of the location of pin5 for U1 on the AGC board. Is it near the edge of the board next to C1?

I appreciate the assistance of anyone that can help.
Mike

From: Dale Parfitt
Topic: 2971 Message: 2972

Hi Mike,
Look at the manual as it shows at least one photo of the installed board.
I think instead of lifting pin 5 on the new rigs I would remove the two fixed resistors that take the place of the pot. Then just attach the AGC out to the common pad left by removal of the SMD resistors. An Ohmmeter will quickly locate the proper pad.

Regards,

Dale W4OP

Page 5 of the manual shows the white wire from pad 4 of the AGC board to pin 5 of the MC1350 IC.
After removing the 2 SMD's (if that is what you choose to do) just use your VOM from pin 5 (power disconnected) to the pads from which you removed the SMD reistors. The pad that is common to pin 5 is the pad to solder the AGC wire to. Or, as before, use a pair of flush cutters to cut pin 5 loose from the PCB and attach W4 directly to the leg.

Hi Mike,

I am certainly thankful that Dale is here for us. I am a "night shift person" and don't get on the computer until at the earliest noon, and lately a little later.

When you look at an ic there is a notch in the middle in most cases only on one end of the case. Sometimes it is a dot by pin 1 but the little notch is more common.

An IC is "normally" numbered relative to that notch. With the notch pointing up or toward the top the pins are then "normally" numbered on an 8 pin IC with the top left pin as pin 1 , then 2,3,4 to the bottom on the left side.

Now the right side of the chip, the numbers start on the bottom of the IC and are 5 Lower Right Corner , 6,7,8 going up.

Pins 1 & 8 are the two pins closest to the notch, but on different sides of the chip. Here is a crude picture of it.

```
u
1 8
2 7
3 6
4 5
```

Thank you, again. Now to show you my ignorance again, when testing the final voltage on pin5 of U1 on the AGC board, I assume the pos for the meter goes to pin5 and the neg goes to any ground? And am I correct in assuming U1's pin5 is on the outer edge of the board by C1?

Has anyone done the AGC mod on an original (non-pro) X1M? I am interested in getting a kit, but I need to know what the differences are. I remember Dale mentioning that one of the chips that needs to be connected-to is SMD in the older model.

You are wanting to measure the voltage on pin 5 of the MC-1350 in the radio Mike.

I think I was thinking a little different than you, I was thinking radio and you were talking board. The pot on the board is used to set the voltage on pin 5 of the chip in the radio. So your positive meter probe goes to the radio MC-1350 pin 5 and a convenient ground point on the board.

Does this help ?

Neil the MC-1350 is indeed a surface mount device in the original model
that had the round buttons. The kit will work, but I would say unless
you work with surface mount regularly, it will certainly be a challenge.

As long as you think it is POSSIBLE to attach to the pin of the SMD MC-1350, I'll take one. I have a friend that deals with this stuff for a living who can assist.

Neil,

I have one of the old units, and added the AGC board with no problems.
Actually, I removed the small pot (and cap) that that was on the MC1350,
(they are no longer needed) and then ran the wire to one of the pads.
To me, it was a lot easier than trying to lift the pin of the device.

Neil I have no doubt that a person that deals with it regularly can accomplish that. However to confirm my belief, I will actually try it myself and I have Parkinsons like tremors in my hands and vision problems, so if I can do it successfully, I'll let you know for sure. I'll catch one of my "good" soldering times. I want people that buy it to indeed be able to use it.

Hello Joe,

A couple of things that spring to mind immediately. Have you chosen IC-718 as the radio?

Secondly, your version of MAY not be compatible with W7 and you may have to run it using the "XP version" available as a component within W7 (Click on start, click on help and support and type" compatibility mode" in the search window for instructions. Older programs not compatible with W7 may still be run if this option is chosen.this MAY be your problem. Good luck in solving it

Subject: [X1M_QRP-Transceiver] Programming Cable and Blue Screen of Death

I have a stable (normally) working Win 7 PC. I bought the X1M Programming Cable and it doesn't seem to function very well. I purchased and I'm still awaiting the new "Pro" Panel. In the mean time, I've been using the XM1 with HRD and the performance is very poor. When attempting to change frequencies, HRD almost always hesitates which is really frustrating! Eventually after running for a few minutes, HRD will either lock up or the computer will "blue screen" because of this, I'm concerned about using this set up to update my firmware with my Win 7 PC. Is there anyone out there who have had similar issues? I have attempted various port settings including flow control, speed, etc. to no avail. Any input would be appreciated.

Thanks,

K7ZT, Joe

CONGRATULATIONS Mike !! Actually it is no small feat for someone new to doing this.

Hopefully this will just be the beginning for you of enjoying building kits and other circuits.

Dale is working very hard, in his spare time, which he has precious little of, on another great accessory for the X1M, especially if you work CW.

You might also want to consider adding the 9 MHz. notch filter too.

If you do enjoy things like what you just did , you might consider getting you a cheap breadbaord and power supply off of eBay. Less than $10 total, but a lifetime of fun. I use mine almost every day and I know Dale uses his regularly also.

Here is a page by a friend of mine, that offers a wide variety of hobbyist electronic projects that are easy to build, inexpensive, and actually serve a useful purpose when you are done. www.techlib.com . Also be sure to check his Circuits link to more projects .

Thank you Charlie. This is definitely not the end. I already have a bunch of other kits coming that I ordered after building the AGC.
Where's the info on the 9Mhz filter? I also want to do the speaker. Have you done that yet (if so, was it worth it?)?
I will also be doing the CW filter when Dale is finished with it.

2997. Re: [X1M_QRP-Transceiver] RE: AGC KIT AVAILABLE

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-19 01:22:55 UTC
From: Dale Parfitt
Topic: 2961 Message: 2997

It may even be easier with the SMD 1350, as it just means lifting a leg as opposed to try pulling it out of a plated through hole or cutting the leg as in the DIP package.

As long as you think it is POSSIBLE to attach to the pin of the SMD MC-1350, I'll take one. I have a friend that deals with this stuff for a living who can assist.

2998. S Meter Circuit In Files

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-19 05:00:40 UTC
From: <disklog@...>
Topic: 2998 Message: 2998

I have posted an S meter circuit in the files section. I built it and tested today and it works well with the AGC circuit board designed by Dale. Please note: You must have a working AGC board in your radio before you can add this circuit.
The entire circuit is small enough that it can be built with large through hole parts and mounted inside the meter box. Three wires are needed to be brought out of the radio- 9vdc, Ground, and the AGC signal from pin 5 or from the W4 pad on the AGC board.
How you do this is up to you.
To test the circuit I used an edgeview S meter from an old CB radio. Most any low current meter will work.
Have fun,
Ken N2LZV

2999. Odd audio problem?

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-19 06:26:58 UTC
From: Daniel Stine
Topic: 2999 Message: 2999

I've been testing my radio over the past couple of days because I had the sneaking suspicion my signal wasn't getting out. Anyway, I have the most recent X1M Pro, just ordered it about 10 days ago and it arrived about five days ago. Last night, I tried testing it with two of the local hams, neither was able to hear me. So today, I decided to test it again. This time, I used a Grundig SW radio with SSB reception as the receiver, and I transmitted it into a dummy load. I was able to receive a faint signal. I could hear myself, but it sounded quieter than it should've been and kind of distorted. With the antenna hooked up (an MFJ-1621 indoor antenna), all I could receive was a harsh static noise, no voice. I'm assuming that's to be chalked up to it being an MFJ antenna, I've heard that some people have had problems with that antenna and the solder joints. But the audio problem is a different sort. I would've tested CW as well, but I need a 1/4" to 3.5mm adapter, which is in the mail. Has anyone had any audio problems like that before, quieter and distorted? I can't get a good recording of it, unfortunately. The signal out of the speaker is too weak.

Have you adjusted the microphone gain pot inside the top cover ? Also a CW power reading is needed to go much further . Also check your microphone plug and see that all of the wires have a solid well soldered connection. Mic gain is discussed in the manual.

3001. RE: [X1M_QRP-Transceiver] S Meter Circuit In Files

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-19 07:22:26 UTC
From: Ian Coots
Topic: 2998 Message: 3001
Attachments: 1 described; binary payloads are missing from this source WARC

Hello Ken,

I was just talking to Charlie about this today so your email re: the S meter is very timely.

A question… Does the 5v need to come from inside the radio, or could it be sourced from the radio's initial 12-14V external power supply/battery?

If so, that would only mean 1 wire to come from within the X1M, and if I'm not mistaken, pin 9 on the DB9 socket is not being used for anything so that could be used.

Regards,

Ian Coots (VK3YIC)

I would also add that the distortion issue is likely fairly easily corrected , but first things first, be sure to adjust the microphone gain . Also one other thought, is to measure the voltage to the radio and current too, would be helpful doing the CW power test. ALL of your testing should be into a good 50 ohm dummy load , for troubleshooting your problem.

Also on the receive issue , it may or may not be antenna related . We can address that issue also once we get a bit more information.

3003. X1M pro LF/MF TX Test

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-19 09:37:41 UTC
From: Joe
Topic: 2998 Message: 3003

Hi group,

this morning, after finishing LPF for LF and MF I checked the output of the X1N Pro on 136kKz and 476kHz.

First of all, DON´T TRY TO TRANSMIT ON LF!!!

There is no output power detectable but the drawn current reaches 3A!

The radio is getting realy hot, so I stoped further test on this Band.

Setup: X1M -à LPF à Antennascope à Dummyload

The signal on MF is ok, but max output is 22,5mW! Thats enough to drive a amp. Unfortunaly my antenna is tuned to LF so I ´did not test it on the antenna but will do next weekend.

I put some pictures of the test in the photo section.

BTW; Antennascope; channel1 = Voltage/50Ohms 1V on the scope = 50V channel2= antenna current 1V = 1A

Hi Hans,

how did You messure the 4. 5W on LF/MF?

I got the same result of abt. 6 Watt on 136kHz, messuring bradband.

But it is unfortunaly not so interesting what is transmittet on 9 and 11MHz, You need to messure the desired frequency.

I was wondering why I was not vissible in DK7FC QRSS Grabber, regular with 5 Watt no problem, but nil with the X1M.

Hi Joe,

I agree with Hans . Many of us have been experimenting with and also using it on MF / LF . I too see roughly 4.5 watts on 2200, 1750, and 600 meters into a 50 ohm dummy load.

I only wish they would lower the bottom frequency limit of the radio, below 100 kHz. It is a very very simple software change for the controller. It would be nice to have 4K meters available and to be able to listen to WWVB on 60 kHz. There are also several commercial stations in the USA in the 20 kHz. range, that many people use as a reference signal for their home built SID receivers. I use 60 kHz., WWVB , but have a dedicated home brew almost too simple of a receiver to use for my signal source for logging and charting SID events with. So I would like to see how the X1M does for a SID reference receiver.

I have been active on these frequencies for more than a decade now, and had the power output, checked for me, by an original X1M owner in Canada , before I bought my X1M PRO and the power output he had on all of the mentioned frequencies were the ultimate deciding factor in my buying my radio.He had 4 plus watts output on all of the frequencies in question, and is a member of this group also.You can check the message archive for my questions and his answers just prior to my purchasing my X1M.

What do you show on a dummy load without your filters ? What are the design parameters of your filters ?

It is being successfully used on Opera, WSPR, and QRSS in other countries too.

I'll have a look at your photos, but I have tried it on 3 different X1M's and all were successful with my tests. I am finishing up a 4th X1M tomorrow and checking on those bands is always a part of my full and final testing.

There must be a problem somewhere in your X1M setup. Also what kind of loading coil and LF antenna are you using ? Which version X1M are you using ?

What MF band/frequency are you testing on ?

I am quite certain others like Hans and myself using it successfully in all of these ranges will weigh in with the positive results that they too are experiencing.

As a matter of fact, you are the first person that I have seen any issues on these frequencies, so I am certain that we will all be

interested in learning more about your entire system.

Best 73 , Charlie, W5COV

Hi Charlie,

Output without filter = abt. 6Watts on 136kHz, abt 4.5Watts on 475 kHz. Most of it is seen at abt. 9 and 11 MHz on SpectrumAnalyzer

Filters are shown in the photo section. Testet this morning with 1,2kW.

Sorry I´m very active on LF but did not hear anybody using X1M.

Loading coil 1,6mH to Inverted-L, 65ft high, TopC 3x 150ft with 3ft spacing

X1M Pro, last firmware.

73 Joe

What MF band/frequency are you testing on ?

I am quite certain others like Hans and myself using it successfully in all of these ranges will weigh in with the positive results that they too are experiencing.

As a matter of fact, you are the first person that I have seen any issues on these frequencies, so I am certain that we will all be interested in learning more about your entire system.

Hi group,

this morning, after finishing LPF for LF and MF I checked the output of the X1N Pro on 136kKz and 476kHz.

First of all, DON´T TRY TO TRANSMIT ON LF!!!

There is no output power detectable but the drawn current reaches 3A!

The radio is getting realy hot, so I stoped further test on this Band.

Setup: X1M -à LPF à Antennascope à Dummyload

The signal on MF is ok, but max output is 22,5mW! Thats enough to drive a amp. Unfortunaly my antenna is tuned to LF so I ´did not test it on the antenna but will do next weekend.

I put some pictures of the test in the photo section.

BTW; Antennascope; channel1 = Voltage/50Ohms 1V on the scope = 50V channel2= antenna current 1V = 1A

Hello, It is 9v not 5v and it can come from anywhere.
Yes in fact you could bring the agc line out on the spare db9 pin, grab ground from the case or anywhere and use external 9v from the source to the rig.
I plan to place a pushbutton on the s meter housing that brings up cw for tuning. So I would need an additional wire or two.

Hello Ken, I was just talking to Charlie about this today so your email re: the S meter is very timely. A question… Does the 5v need to come from inside the radio, or could it be sourced from the radio's initial 12-14V external power supply/battery? If so, that would only mean 1 wire to come from within the X1M, and if I'm not mistaken, pin 9 on the DB9 socket is not being used for anything so that could be used. Thos edgewise meters are a good choice Ken. Millions are still out there- about 90% of the CB rigs used them as did early Icom V/U radios, Clegg, Regency, Midland, Index Labs- on and on. Most are 200uA with a field coil in the under 1K range. Many also have +12VDC backlighting. Dan's Small Parts has several versions. You can open them up easily (held together via Scotch tape) and swap scales or make your own scale.
Quite a few you find will have stuck needles. Open up the meter and put a drop of lacquer thinner on the tensioning adjustment to melt the paint that was put there to lock the screw. After a minute or so, you can take a jewelers screwdriver and back off the tensioning screw until the needle swings freely. The paint will reharden on its own.

Hi Joe,

Thank you for sharing your information and also the pictures. It is much easier to see what you are dealing with.

There certainly is an issue with your X1M at LF.

Our number of stations here in the USA are probably fewer in number than most other places in the world at the present time, since the FCC has not given us any ham bands below 160 meters. Everyone here that operates MF/LF here must do it under experimental rules, either part 15 low power , or part 5 high power in certain areas.

However I have had e-mails from other areas of the world where the X1M is also the radio that they are using on MF/LF and it has a higher number of owners/users , than any other single commercially built radio that I am aware of. Since I don't see many using Juma here, that is the only other numbers that I can't compare it to.

I have had several people e-mail me from other countries, where they have a higher level of activity,than we have here, that are successfully using the X1M.

My only problem so far with the X1M on MF/LF is just that the receiver is not as sensitive on those frequencies, however that is also true of almost every other commercial transceiver that I have used also. However I know one person that has been using the X1M as his receiver on 136 kHz. Mine will work well at 600 meters, before it begins to roll off very quickly. I have copied many hours of QRSS and WSPR on 600 meters.

It would be interesting to see just how many X1M's are being used and in what parts of the world. As far as I know, there are only distributors for the USA,Europe, and Australia. Some places they have been available for less time than in other places and the quantities I am certain vary widely between even these 3 distributors.

Perhaps we can get a list of everyone we can that are running these at LF and discuss any issues among us, because our concerns and desires are going to be much different than those of a general user in the ham bands. Based on that alone, our numbers are going to be very low compared to the HF ham band users, so we can certainly use the input and discussion of everyone that does use one at MF/LF.

I am certainly interested in what else that you learn about the particular radio that you have.

Dale,
Yes they are good for our purposes. And, I have done exactly what you have described. My only complaint is for the X1M I prefer a thinner and wider display. Thinner to mount under the rig at the front, and wider to make reading easier. I have a few coming in the mail that I hope will meet my needs. I just fooled around in Word making new scales for the edge meters that are on the way.
Next time I open the X1M I hope to try out a simple power output meter driver. Nothing fancy, just a cheap and easy meter indicator. I am hoping to use the edge meter for S units in receive and relative RF out in transmit.
Recently I have played with noise clippers but I was unimpressed with the results. That project is on the back burner for now.

Hi,
as far as i am understanding its schematics, the X1M is a single conversion transceiver with RX/TX-IF around 9 MHz. In receive mode as well as in transmit mode there ONLY is bandpath filtering when operating within those 5 small amateur band segments. Outside the bands in and output signals only are passing two low pass filters with an Fo at about 30 MHz.
After tuning the X1M to e.g. 475Khz, i found its main DDS to operate around 9475 KHz. When in transmission mode this should result in TWO output signals. One is around 9475-9000 = 475Khz and the second one around 9475+9000 = 18475KHz! Because outside those 5 band segments there is no band pass filtering at all and LPF surpression only will be for frequencys above 30 MHz, both signals must be available at TX output! So under NO circumstances any 'out of those 5 bands' transmission should be made without adding some sort of external filtering. Of course this also concerns the use of other Amateur Bands like e.g. 160m, 30m, 17m aso.
When operating 'out of bands', also attached power meters will be influenced by more than one signal. This means, also its readings can be expected to be quite inaccurate.

LOL , You know me too well Dale !!

Haven't been to bed yet . Got the kits all kitted up and ready to mail
and neck and back were giving me so much pain from looking down,
couldn't sleep, so just decided to stay up and take them to the post office.

More orders this morning so will kit more up this afternoon. I believe
the relays are coming in today, but mail isn't available here until
11:30, so waiting to make a trip to the post office.

One of those days where I'll do a nap from about 4 to 8, then get back
to my regular schedule. This happens every couple of weeks.

I hope to get out long enough to work on my LowFer antenna, since winter
returns tonight or tomorrow , but don't know if my shoulder and neck
muscles are up to it.

I sure want to thank you for taking the time to answer any questions
that I really should be answering. I know how little time you get to
yourself and seems like all of the questions about the AGC kit come in
during the morning, when I am not normally on. I was even confused for a
bit with some of the questions yesterday about the pin numbers and how
and where to take the voltage measurement. I was soooo thankful that he
did a successful install. I was really pleasantly surprised that he did.

I am going to also this evening build me a special area to make the kits
up. I learned a lot about kitting last night, and now have me a system
worked out, just have to get an area set up. Really so much fun I was
browsing my note pad today to find another kit to get started on. This
is fun !!

Need to clarify the TWO ground issue. The PTT on the SLUSB is actually a relay, providing a closure. Mic has an audio ground. Some radios separate the two grounds at the radio (Alinco in my case). The X1M allows you to use the microphone/PTT ground as a common point. There does appear to be some small inductors in series with the grounds, from what I can make out from the circuit diagram. Anyways, the SLUSB works like a charm. The output from the SLUSB is through a transformer, so the DC for the electret microphone does go to ground, but it is current limited, from what I can tell.

Well, the microphone gain isn't all THAT well addressed! We point out where the adjustment is, but that is it. I would suggest working into a dummy load with an SWR meter. Set full scale for CW, then switch to SSB, and set so peak swings on voice go maybe 2/3 up the scale.

For a really good adjustment, you need an oscilloscope and a two-tone generator signal.

Folks,

Klaus makes a good point. You sould check the power after a low pass filter. Since the ferrite transformers on the PA stage may be inefficient at LF frequencies most of the power output may be in the HF sum frequerncy.

Subject: [X1M_QRP-Transceiver] Re: X1M pro LF/MF TX Test

Hi,
as far as i am understanding its schematics, the X1M is a single conversion transceiver with RX/TX-IF around 9 MHz. In receive mode as well as in transmit mode there ONLY is bandpath filtering when operating within those 5 small amateur band segments. Outside the bands in and output signals only are passing two low pass filters with an Fo at about 30 MHz.
After tuning the X1M to e.g. 475Khz, i found its main DDS to operate around 9475 KHz. When in transmission mode this should result in TWO output signals. One is around 9475-9000 = 475Khz and the second one around 9475+9000 = 18475KHz! Because outside those 5 band segments there is no band pass filtering at all and LPF surpression only will be for frequencys above 30 MHz, both signals must be available at TX output! So under NO circumstances any 'out of those 5 bands' transmission should be made without adding some sort of external filtering. Of course this also concerns the use of other Amateur Bands like e.g. 160m, 30m, 17m aso.
When operating 'out of bands', also attached power meters will be influenced by more than one signal. This means, also its readings can be expected to be quite inaccurate.

Hi MF-Fans,

I made two scans with my analyzer with the X1M without any filtering and
TX-QRG = 475 kHz.
The results are quite nice!
Joe and Klaus are right, filtering is absolutely neccessary.
The filter has to absorb most of the power transmitted.

You make an excellent point Hans- the filter must be absorptive NOT reflective. The simplest solution might be a homebrew diplexer with the HF port terminated in 50 Ohms. There are many 5-10W 50 Ohm loads with an SMA connector available.

David:
Thanks for the suggestions. I can live with the delay issue but the Blue Screen is a real hassle. I tried un-installing HRD and the driver. Reloaded and the problem.. I'm beginning to think that it has more to do with Win7. I've had issues with other Ham Radio Applications and after doing some research the root problem had to do with the drivers, or lack of for Win7. I never had issues with XP. I do have another PC with XP but it older and not anywhere as near as robust as my Win7 Machine. I did try to use FLDIGI and can't seem to get it to talk to the serial port. Any thanks again for the assistance!

GM Joe,

I don't know if this will give you any insight or not. I bought the programming cable with the X1M.

 My computer uses XP and I don't use HRD but I have tried rig / computer control running FLDIGI. With my setup, there seems to be a second or two delay between stimulus and response either way the command goes. (rig>computer or computer>rig) It seems like it may be an X1M thing more than a programing cable thing. :-)

Joseph,

If you would like I can drag my X1M and cable to work where the computer runs W7 Enterprise and see if I get the BSOD or other nasty reactions. I have FLDIGI installed there also.

When I first plugged the interface cable in my machine at home it assigned it Com port 6. My regular installation uses Com Port 1 for control of my TS-2000. Info transfer seems very fast.

Thanks very much! Adjusting the gain did the trick for both problems. I'm still not sure whether my signal is getting out far, but I do know that my SSB receiver picks up my voice at a natural level now, even with the MFJ antenna.

Thanks Ken…sorry about the 5V.

I have an external switch that shorts the key output that I use for tuning…no additional external wires required, however I do have to select CW manually from the X1M Function Buttons.

Regards,

Ian VK3YIC

Hello, It is 9v not 5v and it can come from anywhere.
Yes in fact you could bring the agc line out on the spare db9 pin, grab ground from the case or anywhere and use external 9v from the source to the rig.
I plan to place a pushbutton on the s meter housing that brings up cw for tuning. So I would need an additional wire or two.
Ken

Hello Ken, I was just talking to Charlie about this today so your email re: the S meter is very timely. A question… Does the 5v need to come from inside the radio, or could it be sourced from the radio’s initial 12-14V external power supply/battery? If so, that would only mean 1 wire to come from within the X1M, and if I’m not mistaken, pin 9 on the DB9 socket is not being used for anything so that could be used. Subject: [X1M_QRP-Transceiver] S Meter Circuit In Files I have posted an S meter

circuit in the files section. I built it and tested today and it works well with the AGC circuit board designed by Dale. Please note: You must have a working AGC board in your radio before you can add this circuit.
The entire circuit is small enough that it can be built with large through hole parts and mounted inside the meter box. Three wires are needed to be brought out of the radio-
9vdc, Ground, and the AGC signal from pin 5 or from the W4 pad on the AGC board.
How you do this is up to you.
To test the circuit I used an edgeview S meter from an old CB radio. Most any low current meter will work.
Have fun,
Ken N2LZV

Hi Mike,

The mic pot doesn't have any stops in it and so just actually will make only one 360 degree revolution, even though you can keep turning it.

There is generally a pronounced "sweet spot" for the audio. Since you are using yours already , listen to it on another receiver and just slowly rock the pot back and forth for the best audio while talking into the mic or you can rotate it once through the entire revolution until you hear the "sweet spot". This is a quick and easy way to adjust it .

The correct by the book method is to use a scope and a two tone generator.

If you give it a try let me know if it still displays just the one pronounced "sweet spot." I am assuming it does since the fellow in the early morning hours had a radio out of the new batch.

Thanks Charlie. I was curious because I also noticed some SSB issues. Even though the manual said it wasn't likely you would need it, I went ahead and turned it 45deg since I had nothing to compare it to.
I since have had it with another receiver and that showed I was coming through fine. There was marked difference in my output on the meter. Unfortunately it wasn't open so I could play for sweetness. I have to go back in to replace the speaker and will do it then.
Thanks again!

Since many people have just received their first ever X1M within the
past couple of weeks from the latest production run, I think that they
are the ideal people to answer your query Joel.

Hopefully many of them will respond with their experience.

3035. Relative RF meter Circuit Added to Files

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-20 03:51:51 UTC
From: <disklog@...>
Topic: 3035 Message: 3035

Tonight I added the circuit diagram for a relative RF meter that can be connected to the X1M and X1MPro.
I have built and tested this circuit with my X1M and it works quite well.

The best installation would be to mount everything except the meter inside the radio as near to the antenna connector as possible. It is a tight squeeze but it can be done with very small standard parts. Surface mount parts would fit even better.
I have NOT tested this circuit in conjunction with the S meter circuit. They should play well together but I haven't tested them together. I won't be able to make that test until my replacement AGC board arrives here.
I invite any improvement, comments or suggestions.
Ken N2LZV

The latest version works well. I have had it on all day every day with no issues. I have made several modifications to my unit but those mods are not required. The radio is well behaved as it comes from the factory.
My mods are:
Changed the final transistor for more rf out.
Added heatsinks where I wanted cooler running.
Added AGC
Added S Meter
Added RF output meter
Changed the internal speaker (But change wasn't needed)
Added a 4 conductor jack on the rear.
Adjusted internal mic control for better audio

That's all I can think of right now.
Please understand that with the exception of the mic adjustment, nothing else needed to be done. The radio performs well.
Hope this helps

Thanks Ken,

That's what I wanted to know. How much power out we're you getting with the old final vs the new and what transistor is used, is it a FET? I dont mind making mods to mine and I'm more than capable to do them, I just want everything to work as advertised when I get it. I had heard that some were dead on TX output upon arrival so just wanted to make sure that kind of stuff was fixed. BTW, how's the receive audio, is it loud enough? Sorry to ask so many questions.

Hi Joel,

I don't know where everyone is tonight.

The radio with the latest firmware version installed, works VERY well right out of the box, on any mode. Many people are using them with an interface and running the digital modes with it also.

You will very likely want to adjust the sidetone volume, and microphone gain, when you receive the radio. The controls are located underneath the top cover and easy to access and adjust. They are single turn pots that just require a small screwdriver to adjust.

I would recommend that you do also buy a programming cable at the same time that you get the radio. If there are any new firmware updates, you can do them in less than 5 minutes and keep the radio current.

The cable can also be used to control several of the functions on the radio with the free edition of HRD.

To the best of my knowledge there is no radio or kit available from ANYONE , in this price range that can provide you with such an economical TRUE FULL FUNCTION RADIO !! I don't even know of any anywhere close to the quality, price and performance of this radio on the filtered bands.

One can also add additional external filters for the band of your choice. It actually covers from 100 kHz. through 30 MHz.

Until you actually see one in real life, you will not believe just how tiny this radio is and all of the functions that it has. It operates well on both CW and SSB. It also is a true 5 watt radio, with the average power probably being about 4.5 watts output on all of the included bands.

One HUGE feature of it is that you do NOT have to carry an operating manual or cheat sheet of ANY KIND with it. No big menus to go through, only for changing setup parameters. Then it is a simple text straight forward menu that you will likely never see once you do your initial setup.

The buttons and two knobs are clearly labeled and perform the function immediately from the front panel, that they say they will do , such as changing keyer speed , modes, preamp, etc. VERY straight forward and right on point.

I really would like for the most recent buyers to relate their own personal experience with it , since it is a radio that is new to them, and they can tell you how easy it is to operate and how they are having

a ball working stations with this QRP rig, much like if they were running QRO.

If you have any specific questions , this is one of the best support groups that you will find ANYWHERE, and they can tell you just how solid Ed is on backing these radios up , should you have an issue. I am CERTAIN some of them will show up on here so you can hear it from a brand new user.

Best 73 , Charlie, W5COV

Thanks. Charlie,

It's sounding better all the time. I will pickup the programming cable when I order the radio. Where is the best place to buy it from, the Wouxun.us site?

Five watts sounds good to me as I worked many stations this last summer on my home brew equipment running only 3 watts into a EFHW wire with a matching box and a Jackkite pole. Thanks again.

Yes Joel, Ed is the best of the best to deal with. He is also the only authorized distributor / dealer in the US.

We normally go through his web site , www.importcommunications.com

I will add that the low audio has been permanently changed in the current model, so that you don't have to do the audio mod , that Dale, W4OP (Original designer of the PAR EFHW antenna) , came up with for the models previous to the current one.

It does use a MOSFET final , however as far as I am aware only one final has ever had to be replaced and it was not on a new radio, so we don't know why it did fail.

If you like to also make mods, play and experiment, it is also a great radio for that too.

I sell an add on SMD AGC kit for it, that fits inside of the radio, that was also designed by Dale, W4OP. He is currently working on an internal CW crystal filter for the radio. You can see several group member projects in the photo and files section. The final mod, an "S" meter mod just posted today. A speech processor that can be built inside of the microphone and powered by the radio. A multi band filter add on. A very active and intelligent group of owners and operators on board here in this group and ALWAYS willing to help one another.

Hope you will be joining us with a new rig very soon.

3041. S Meter scale

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-20 05:52:55 UTC
From: Ian Coots
Topic: 3041 Message: 3041
Attachments: 1 described; binary payloads are missing from this source WARC

Hello,

I have uploaded a pdf into the files section of a printable scale for an S-Meter.

It is sized to suit the common (in Australia) µA panel meters that are 58mm wide x 52mm high, but can be printed to suit any sized meter using the % enlarge/reduce function of most printers.

I took the scaling from information from the ever reliable Wikipedia so hopefully it will be correct. Just print it to a label and stick it to the face of your meter after checking the edges of the scale match the edges of the scale on the meter.

Regards,

Ian Coots VK3YIC

Joel,
Prior to this radio, I have owned a kx-3 and both models of the 817. My only kit building experience has been a pico keyer plus and the pixie 2.
If you buy this radio with the understanding that it is a pretty good receiver, will def work in the guaranteed bands, CW is fine and is only $350 dollars you'll be a happy camper.
Now, if you are willing to crack the case and do some minor work (install AGC kit, upgrade the speaker [not a necessity] get the soon to be available CW filter and do a simple alignment) you will love this radio.
This yahoo group has been great and the radio has become a passion of mine. It's the best combination of a commercial radio and since of pride/"My Radio" that you get from a kit. It's worth every penny and more if you ask me. And, it's only improving.
Did I mention this Yahoo group is great?

Yes, get the cable from Wouxun.US. It is NOT a standard RS-232 to USB cable. (See discussion in User's Guide)

I used my first one (had problems with output, got a replacement) as a field radio this summer for both SSB voice and digital modes.

GREAT radio!

Dale,
I tried to calibrate the S meter using my HP signal generator. I used 100uv for S9 in my unit. I used USB on the radio and AM on the generator. I had to tune the radio off frequency and listen for the loudest AM squeal. I then adjusted the S meter for 100uv at S9. I tried other ways to calibrate but tuning the AM off frequency seemed to correspond to strong SSB reception.
50uv for S9 and 100uv for S9 are both standards still used today. The 100uv setting appeared to work better for the X1M.
Please keep in mind that this is audio derived AGC and the S readings and can best be described as "approximate" .

Subject:
[X1M_QRP-Transceiver] S Meter
scale

Hello,

I have uploaded a pdf
into the files section of a printable

scale for an S-Meter.

It is sized to suit the
common (in Australia) µA
panel meters that are 58mm wide x 52mm high, but can
be printed to suit
any sized meter using the % enlarge/reduce function of
most
printers.

I took the scaling from
information from the ever reliable
Wikipedia so hopefully it will be correct. Just
print it to a label and
stick it to the face of your meter after checking the
edges of the scale match
the edges of the scale on the meter.

Regards,

Ian Coots VK3YIC

By the way, Last night I posted 2 responses to Joel's questions and I don't see them yet. Yahoo hates me.

Also I posted that a relative RF meter circuit has been added to the files section. I don't see that either.
Yahoo really hates me!

Hi Ian,
I am not sure if Ken has
done any absolute
measurements. Few S meters are accurate- the Elecraft K3 and
the Adat 200A come
to mind that can be calibrated in dB or dBmV. Most meters
are simply relative
field strength.

I understand Ken- nice work. Did you look at say 6dB increments down from there to see if S unit calibration was possible?
One of the issues with most rigs today is that the preamp effects the S meter reading- it should not. Only Elecraft and Adat and possibly ANAN have addressed this in their designs so that it is possible to zero out the preamp gain in firmware. Guess that rant is a bit off topic here.

On a different topic. I seem to recall being able to search Yahoo Group messages with key words. I cannot find the search field in their "improved" pages. Is it still possible to search?

Dale,
I tried to calibrate the S meter using my HP signal generator. I used 100uv for S9 in my unit. I used USB on the radio and AM on the generator. I had to tune the radio off frequency and listen for the loudest AM squeal. I then adjusted the S meter for 100uv at S9. I tried other ways to calibrate but tuning the AM off frequency seemed to correspond to strong SSB reception.
50uv for S9 and 100uv for S9 are both standards still used today. The 100uv setting appeared to work better for the X1M.
Please keep in mind that this is audio derived AGC and the S readings and can best be described as "approximate" .

Dale,
No I did not do the 6db check. I did my calibration with the preamp off. When I turned the preamp on it did increase the S meter action a bit. I can live with it as is. Maybe when I have a permanently installed AGC board I will go over it all again. Right now the S meter and the RF output meter are all built up on Protoboards and connected by wires into the opened radio. It is a mess, but it works nicely.

No I can't find a search in the new yahoo groups either. I miss that search and I really dislike the new yahoo. Most of the time it will not let me post photos. This has been a very poor design change by the yahoo company.

From: Dale Parfitt
Topic: 3055 Message: 3055
Attachments: 1 described; binary payloads are missing from this source WARC

I received the remainder of my crystal order last night and built up a prototype filter. I am amazed at how well the real world filter agrees with the synthesis/simulation. NO attempt was made to match crystals. While I am FAR from done, it is very encouraging to see the filter plot, center frequency, and loss in agreement with the software design. Next step is to design IN/OUT matching networks to transform the native 69 Ohms up to the required 500 Ohms and hardwire it into the radio. If that passes, then we'll figure out how to do the switching so the filter will automatically be enabled when CW mode is selected. I'll see if I can put an image in this post.

Hello Ian,
Your S meter scale is much nicer than anything I can make. Is there any chance you can make the same scale in a straight line rather than the curved line? I am thinking of using it to replace the scale on an edge view meter. Be nice to have both types of scales available for either type meter.
My meter will be horizontally mounted under the radio at the front.
Thank you, Ken

Hey Dale, I can actually answer the search question !!! lol

They hid it in plain sight in large enough print for we old codgers !!

Took me a while to figure it out with the change. It is the big box on the top of the page next to the purple "Search Groups" button (left side of button).

Charlie , W5COV

One of the issues with most rigs today is that the preamp effects the S meter reading- it should not. Only Elecraft and Adat and possibly ANAN have addressed this in their designs so that it is possible to zero out the preamp gain in firmware. Guess that rant is a bit off topic here.

On a different topic. I seem to recall being able to search Yahoo Group messages with key words. I cannot find the search field in their "improved" pages. Is it still possible to search?

Dale,
I tried to calibrate the S meter using my HP signal generator. I used 100uv for S9 in my unit. I used USB on the radio and AM on the generator. I had to tune the radio off frequency and listen for the loudest AM squeal. I then adjusted the S meter for 100uv at S9. I tried other ways to calibrate but tuning the AM off frequency seemed to correspond to strong SSB reception.
50uv for S9 and 100uv for S9 are both standards still used today. The 100uv setting

appeared to work better for the X1M.
Please keep in mind that this is audio derived AGC and the S readings and can best be described as "approximate" .

Hi Ian,
I am not sure if Ken has
done any absolute
measurements. Few S meters are accurate- the Elecraft K3 and
the Adat 200A come
to mind that can be calibrated in dB or dBmV. Most meters
are simply relative
field strength.

[X1M_QRP-Transceiver] S Meter
scale

Hello,

I have uploaded a pdf
into the files section of a printable
scale for an S-Meter.

It is sized to suit the
common (in Australia) µA
panel meters that are 58mm wide x 52mm high, but can
be printed to suit
any sized meter using the % enlarge/reduce function of
most
printers.

I took the scaling from
information from the ever reliable
Wikipedia so hopefully it will be correct. Just
print it to a label and

stick it to the face of your meter after checking the
edges of the scale match
the edges of the scale on the meter.

Regards,

Ian Coots VK3YIC

LOL , Ken, I just got lucky, but I happened to want to look up one of your messages and remembered having tried before and not seeing how to do it.

When I FINALLY saw how to do it, I felt pretty bad about how simple it was and how much time that I had spent looking right at it and not realizing it !!

I guess it makes those of us that had the problem , true Old Timers !! <grin>

Glad to find out that I wasn't the only one with the issue. Now I don't feel as bad :)

Hi MF-Fans,

in the meantime I've built a simple low-pass-filter for 475 khz.
as the first part of a diplexer. In the attachment there are some jpgs of the
filter-response, the analyzer-results and the filter itself.
similar to Joe I measured about 20mW on 475 kHz.
But I think it is worth to follow this path. Maybe a steeper filter could suppres the 1st
harmonic more than the 40dB as it is now.
Amplification is not the problem, hi

X1M pro LF/MF TX Test
>>
>>Hi,
>>as far as i am understanding its
schematics, the X1M is a single
conversion transceiver with
RX/TX-IF around 9 MHz. In receive
mode as well as in transmit mode
there ONLY is bandpath filtering
when operating within those 5
small amateur band segments.
Outside the bands in and output
signals only are passing two low
pass filters with an Fo at about
30 MHz.

>>After tuning the X1M to e.g. 475Khz, i found its main DDS to operate around 9475 KHz. When in transmission mode this should result in TWO output signals. One is around 9475-9000 = 475Khz and the second one around 9475+9000 = 18475KHz! Because outside those 5 band segments there is no band pass filtering at all and LPF surpression only will be for frequencys above 30 MHz, both signals must be available at TX output! So under NO circumstances any 'out of those 5 bands' transmission should be made without adding some sort of external filtering. Of course this also concerns the use of other Amateur Bands like e.g. 160m, 30m, 17m aso.
>>When operating 'out of bands', also attached power meters will be influenced by more than one signal. This means, also its readings can be expected to be quite inaccurate.

From: Ian Coots
Topic: 3041 Message: 3064
Attachments: 1 described; binary payloads are missing from this source WARC

Yes Dale that□s what I figured. The scale looks like a □sort of logarithmic scale but not□ and as It□s basically used to tell someone if they Have an S7, S9 or 20 over, my guess was that is wasn□t all that critical.

If someone wanted to be pedantic, they could follow the □instructions□ listed in the Wikipedia S-meter article and calibrate it properly by applying the stated voltages, but for me that□s way too much information and I also don□t have the equipment.

I guess the other way it to use an ex CB meter as suggested. My scale was for those like myself who had a µA panel meter and wanted a more meaningful scale.

Thank you for the feedback. As always your input to this group is greatly appreciated.

Hello Ian,
Your S meter scale is much nicer than anything I can make. Is there any chance you can make the same scale in a straight line rather than the curved line? I am thinking of using it to replace the scale on an edge view meter. Be nice to have both types of scales available for either type meter.
My meter will be horizontally mounted under the radio at the front.
Thank you, Ken

in the meantime I've built a simple low-pass-filter for 475 khz.
as the first part of a diplexer. In the attachment there are some jpgs of the filter-response, the analyzer-results and the filter itself.
similar to Joe I measured about 20mW on 475 kHz.
But I think it is worth to follow this path. Maybe a steeper filter could suppres the 1st harmonic more than the 40dB as it is now.
Amplification is not the problem, hi

73 and merry christmas to the group

Thank you Hans !! A picture is worth a thousand words ....

Thank you for the idea too Dale !!

However I think this is out of my league, so I will be interested in seeing more information from those of you with expertise in the field.

Time for me to take a few lessons, from you guys.

Nap time :)

Charlie, W5COV

On 12/19/2013 1:18 PM, Dale Parfitt wrote:

□

You make an excellent point Hans- the filter must be absorptive NOT reflective. The simplest solution might be a homebrew diplexer with the HF port terminated in 50 Ohms. There are many 5-10W 50 Ohm loads with an SMA connector available.

Subject: Re: [X1M_QRP-Transceiver] Re: X1M pro LF/MF TX Test [2 Attachments]

Hi MF-Fans,

I made two scans with my analyzer with the X1M without any filtering and
TX-QRG = 475 kHz.
The results are quite nice!
Joe and Klaus are right, filtering is absolutely neccessary.
The filter has to absorb most of the power transmitted.

On Thursday, December 19, 2013 7:20 PM, "mstangelo@..." <mstangelo@...> wrote:

Folks,

Klaus makes a good point. You sould check the power after a low pass filter. Since the ferrite transformers on the PA stage may be inefficient at LF frequencies most of the power output may be in the HF sum frequerncy.

Subject: [X1M_QRP-Transceiver] Re: X1M pro LF/MF TX Test

Hi,
as far as i am understanding its schematics, the X1M is a single conversion transceiver with RX/TX-IF around 9 MHz. In receive mode as well as in transmit mode there ONLY is bandpath filtering when operating within those 5 small amateur band segments. Outside the bands in and output signals only are passing two low pass filters with an Fo at about 30 MHz.
After tuning the X1M to e.g. 475Khz, i found its main DDS to operate around 9475 KHz. When in transmission mode this should result in TWO output signals. One is around 9475-9000 = 475Khz and the second one around 9475+9000 = 18475KHz! Because outside those 5 band segments there is no band pass filtering at all and LPF surpression only will be for frequencys above 30 MHz, both signals must be available at TX output! So under NO

circumstances any 'out of those 5 bands' transmission should be made without adding some sort of external filtering. Of course this also concerns the use of other Amateur Bands like e.g. 160m, 30m, 17m aso.
When operating 'out of bands', also attached power meters will be influenced by more than one signal. This means, also its readings can be expected to be quite inaccurate.

Hello Ian,
The meter I plan to use is in the mail to me. I don't yet know the scale size. The total meter size was listed as .5 inch high and 1.6 inch wide. Those type of meters usually have scales about 9 mm high and 42mm wide but that is just a guess. Is it ok if I email the size to you when it arrives here?

Greetings Folks,

In an effort to cleanup 17 Meters for transmit, I purchased a bandpass filter from kitsandparts.com (universal bandpass filter). Only to find out that it is for receive only, and has high insertion loss. Has anyone on the group actually built a kit for 17 meters that is working good for you? Perhaps someone has a found a simple solution.
Thanks, Rick.

That is always the issue with narrow BP filters. As one narrows the BW (assuming component Q's remain the same) the insertion loss goes up. Same issue I face with designing the CW filter. Can't fool Mother Physics.

I understand Ken- nice work. Did you look at say 6dB increments down from there to see if S unit calibration was possible?

One of the issues with most rigs today is that the preamp effects the S meter reading- it should not. Only Elecraft and Adat and possibly ANAN have addressed this in their designs so that it is possible to zero out the preamp gain in firmware. Guess that rant is a bit off topic here.

On a different topic. I seem to recall being able to search Yahoo Group messages with key words. I cannot find the search field in their "improved" pages. Is it still possible to search?

Dale,
I tried to calibrate the S meter using my HP signal generator. I used 100uv for S9 in my unit. I used USB on the radio and AM on the generator. I had to tune the radio off frequency and listen for the loudest AM squeal. I then adjusted the S meter for 100uv at S9. I tried other ways to calibrate but tuning the AM off frequency seemed to correspond to strong SSB reception. 50uv for S9 and 100uv for S9 are both standards still used today. The 100uv setting appeared to work better for the X1M.
Please keep in mind that this is audio derived AGC and the S readings and can best be described as "approximate" .

[X1M_QRP-Transceiver] S Meter
scale

Hello,

I have uploaded a pdf
into the files section of a printable
scale for an S-Meter.

It is sized to suit the
common (in Australia) µA
panel meters that are 58mm wide x 52mm high, but can
be printed to suit
any sized meter using the % enlarge/reduce function of
most
printers.

I took the scaling from
information from the ever reliable
Wikipedia so hopefully it will be correct. Just
print it to a label and
stick it to the face of your meter after checking the
edges of the scale match
the edges of the scale on the meter.

3077. New Firmware Update

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-21 16:28:03 UTC
From: <ed@...>
Topic: 3077 Message: 3077

The radios that were shipped to me a week or so ago, came with older firmware. I have no idea why this happened but I have been updating these radios to the Nov 20 firmware before I shipped them out. A few days ago the factory sent an email saying the firmware in this last shipment had problems and they were preparing an update. I asked what the problem was and they replied, CW frequency instability and CW frequency offset. I have no idea exactly what they are referring to and if they are referring to the Nov 20 firmware or other. They say they will send the firmware update tomorrow or Monday. I'll post it here when it arrives.

Ed
www.importcommunications.com

ps.
I am finally upgrading my 5 year old pay-by-the-minute cell phone to a Galaxy s3 with unlimited service. I was browsing some Android apps last night and noticed an app for PSK31. Has anyone tried that? It could be a very simple way to do some very basic PSK31 on the X1M with no additional investment.

Not exactly an answer to your question... but... I have an iPad PSK-31 app that works only in receive mode. It has a waterfall display and does a nice job of decoding any one transmission, chosen by touching the appropriate line in the waterfall. The mic on the iPad "hears" the RX audio from my X1M. There is no TX function however... wish there were.

Ed

I have used the PSK31 app on my Galaxy 2 tablet and it works ok. The app struggles a bit with decoding on receive. But all in all not a bad app. The developer has sent out a software upgrade that is supposed to address this problem. I have not used it since the upgrade- its on my long list. The developer makes a cable interface for various radios and will provide the schematic to put together your own I have been using it with my FT-857D so I can't comment on how it works on the X1M.

Google Wolphi - the developer.

I have used DroidPSK since it first came out. It had some problems but it was clearly the best app on Android or iOS. (I have used them all.) I worked with Wolphi, the developer of DroidPSK, on the beta versions up to its release of the non-beta V3.0 a few days ago on Play Store. It is a great app that I use on my HTC Sensation phone and my Nexus 7 (2013). I also use the interface he sells. You MUST have a tablet with a wired microphone input to use a non-acoustic interface. (I have no financial interest in the products.)

No idea where to purchase in Asia.
Maybe you can contact Ed at the Import Communications website and ask him. He imports them to the USA.

For those that have asked, it has been 10 days since I installed the higher wattage mosfet in my X1Mpro. (RD16HHF1)
I have made numerous contacts with no problems at all. The replacement mosfet is made by the same manufacturer as the original mosfet and has the same "withstands 20 to 1 Vswr" rating. The wattage boost was moderate (3 additional watts) given the low drive provided by the driver transistor. However all reports have been good and I am happy with the results and performance.
Just today I made a 1231 mile SSB contact with a ham in New Hampshire, not bad for a QRP radio with a wire antenna.
Just thought I'd provide this update for those that have an interest in these modifications.

Is there a way to increase the drive?
Or....is a way to allow more current through the PA?
Either would increase the output.

Thanks for all of your work Ken. It is very much appreciated to see
people contribute to improving the radio and sharing it with the rest of us.
The next time I have mine open, I will change out the transistor. I
ordered a couple when you first mentioned that you were going to try it.
Listening to transformers explode from the heavy ice storm that we have.
About 1 an hour right now.

The predriver has a 3db attenuator in front of it. I have no idea why but I suspect it is to keep the input to that stage below maximums on all bands and to provide a nice 50ohm match to the mmic.
The driver transistor had a point 1 db attenuator in front of it which isn't reducing much but does provide a nice output match for the mmic. This is an old trick usually used to insure stability with high gain mmic packages. I don't see much in the way of change in either stage to increase the output. I am more inclined to believe that the final mosfet passive components (particularly the coils) could be modified for better output but might change the bandwidth of the final stage. This type of change is WAYYYYY beyond my skill level.
More importantly, any moderate added output will make zero difference on the receive end. It just seems not worth the effort and additional current draw. My transistor change was designed to insure at least 5 watts out on all bands and help compensate for tuner/low pass filter/etc losses.
Having said all this, I too am troubled with using a 16-18 watt transistor for only 8 or 9 watts. So, if any competent RF engineers are out there and want to step up to the challenge, please don't be bashful.
Personally I think this simple mosfet change sort of makes this part of the transmitter bullet proof.

I have uploaded to the files section a simple LED rf output indicator for the X1M or any qrp rig. The sensitivity is adjustable. If a high brightness red LED is used, (or several) one might be able to flood the display with red light when transmitting. Makes a smaller RF indicator than a meter.

This <kind of> goes along with this thread... I've noticed that the
frequency is off about 100hz.

Looking at the calibration constants, there is a ... 32768... value, but
I don't think that's what needs to be modified... it might change the
step size.

Just wondering if the TCXO is what needs to be adjusted. (I noticed a
sticker on top of the module.. maybe there's a variable cap under it).

Anybody else notice this? (I have one of the originals).

Thanks,

Tim W5FN

Hi Mike and group members,

The manual is a "fluid" document, and Paul does a great job of keeping it right up to date.

He has consulted with many people on the group that use all modes and the people that helped develop the parameters of the radio that you own today, as long as you have kept your firmware up to date.

While we are not certain what the upgrade expected for tomorrow is yet, you can be assured it will get tested by those same people and input from ANY group member that finds an issue, that we are not aware of. THAT is what makes the radio as good as it is today.

So if you have ANY questions posting them here, is a good idea. The manual is the most up to date information on the radio. It has gone through MANY changes since that video was made.

Here is the pertinent section of the manual :

***Adjust CW only after you do the IF OFFSET, USB BFO, and LSB BFO settings. Once
you have USB/LSB set to your liking, CW setup is easy. Simply set the CW BFO (Menu
Item #4) = to your IF OFFSET value. Go to Menu item #5 and set the CW Tone to the
tone you like to listen to when copying the station you are working. Typically the value will
be between 500Hz and 800Hz. Note that this value effects only the receive frequency.***

The steps for setting ALL of the offsets are covered in the manual on the same page, and just previous to these setup instructions.

Naturally getting the 9 MHz. IF offset set correctly first is of HIGH PRIORITY. It will vary slightly from radio to radio, but it is the main setting to spend just a little extra time getting it just right for you and your radio. Everything else is mathematically related to this. The CW Tone setting is for your own preference of what tone you prefer to listen to CW. I typically like 700 Hz.

However maybe Dale will add some information here, but I "think" that his CW Crystal filter is going to use 600 Hz.

Hi Tim and group,

You pose a good question that is beyond the scope of the manual. However we are blessed on this group, to have some people with a LOT of expertise in different areas of the radio and the radio is luckily composed of many popular and very common circuits that have been around for quite a while now.

Lee /7 and Stephen Farthing, (OF QRSS FAME:) originally from the UK , both are people with a HUGE amount of knowledge on this particular DDS-VFO configuration.

I am certain that they can contribute to answering your question. Lee /7 has helped me before using a similar setup in another home built project.

3098. ROLL YOUR OWN FILTERS

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-22 23:42:02 UTC
From: Charlie , W5COV
Topic: 3098 Message: 3098

I have just uploaded to the main group page a couple of pages of information from the RSGB , for those of you that wish to operate the X1M on bands other than those covered by the internal filters. It is in the Mods and Reviews section.

These are QRP filters, designed for 10 watts .

They are 7 element low pass filters and are inserted between the transmitter and antenna.

A nice clean and simple layout and certainly recommended when operating on frequencies outside of those covered by the internal filters. Never hurts to be a good neighbor , and gives you any of the bands that you might want.

If any of you are new to winding toroids, they are simple to do. I usually have at least one project every day that involves one or more filter. One caution EACH TIME you just run a wire through the core is ONE turn.

If you need any help , plenty available here on this great group. ENJOY some new bands with your rig !!

IF you need values for the experimental bands, I can provide you with a nice link for those also.

Someone good with ExpressPCB , might want to design a blank board, that we could order in bulk, if there was enough interest. I have a couple of good scans that I could send you of the boards that I regularly use.

Charlie, W5COV

3099. RE: BFO Alignment Questions

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-23 00:21:41 UTC
From: <pal350@...>
Topic: 3091 Message: 3099

My current parameters are:

IF: 8999554
LSB: 8998450
USB: 9000652
CW: 8998754
CW TONE: 800
DDS CLK: 32768
DDS MLT: 1

I didn't mess with the last two at all.

In my particular X1M these parameters make USB and LSB sound almost exactly the same when listening to noise, and WWV is within a few Hz on both sidebands. The crystal filter in each radio will be a little different.

As for setting up CW, it's important to actually understand what the developers are doing with the radio. Here's what I THINK is going on.

The X1M Pro schematic is not easy to read, and there's no theory I can find. But the only places I could find "CW TONE" were on a line coming out of the microprocessor on page 3, and one going into the audio output stages at lower right on page 6.

It appeared to me that the CW TONE adjustment does not affect any RF frequency determining stages. I'm guessing it adjusts the frequency of an audio oscillator implemented in firmware to give the user sidetone while operating CW.

As an example, say I set both my PRC-1099 packset and my X1M to 7.040 MHz. Using the settings above, I can have a CW QSO with myself, and the RX audio out at both ends is 800 Hz.

Then without changing any other settings, I changed the CW TONE to 1800. Result was I still heard an 800 Hz tone in both receivers, but the TRANSMIT CW SIDETONE in the X1M was now 1800 Hz.

I further tested my theory by setting the CW BFO value equal to the IF OFFSET value. This results in the generated carrier going right down the center of the X1M IF and then out the radio dead on the indicated frequency of 7.040. I hear a zero beat in the PRC-1099, which is listening on USB to a straight sine wave carrier coming in at the bottom of the filter (basically getting suppressed, although it's so strong I can hear some crud getting through). Obviously, that won't do.

By moving the CW BFO setting DOWN 800 Hz (which DOES affect an RF oscillator somewhere), the result is a sine wave carrier at 7.040.800. This moves the carrier up 800 Hz in the (USB) filter passband of the PRC-1099 receiver, resulting in a demodulated 800 Hz tone.

An aside on how the PRC-1099 generates CW. When I hit the CW key on the 1099, it applies an 800 Hz audio tone to the balanced modulator, ultimately resulting in a carrier

transmitted at 7.040.800. The X1M presents that as an 800 Hz tone in its audio output.

Just for grins, I set CW BFO to 800 Hz ABOVE the IF setting. Yep, that gives me an 800 Hz audio tone on the 1099 audio, but with the mode set to LSB. The mil standard is CW on USB, to prevent exactly this kind of getting wrapped around the axle, so I set it back.

The totally bizarre thing (until I understand it) is this: while in CW mode as I adjust the CW TONE setting up and down, I can hear the timbre of the X1M audio output change. It's highest at 2000, lowest at 800 then starts going high again until 200, which is as low as the setting goes. It's sounds like the setting is actually messing with the bandwidth of the audio output stages. This happens only in CW mode. It may be what is confusing people into thinking the setting is affecting RF stages. I could be all wet on this, but it sure matches what I see.

So the answer to the question, "How do I set up CW in the X1M" is actually, "It depends on what you want." My choice is to set up the radio so it can talk to any milspec HF pack set, all (or most all) of which send CW in USB mode. If they have special CW filters they are basically just narrower USB filters So set the radio up to put out a sine wave at 800 Hz above the indicated frequency. That means setting the CW BFO 800Hz below the
IF setting.

With these settings I know any SSB radio listening in USB mode will hear my CW at 800 Hz. I also know with the X1M set to CW mode, I'll hear any radio that derives its CW by injecting an 800 Hz tone into its balanced modulator in USB mode.

You may want to set up CW differently. The important thing is to realize that the CW BFO setting is the one that actually affects your X1M's actual transmit freek's relation to the indicated
freek. Setting the CW BFO setting equal to the IF setting will transmit a carrier dead on your indicated frequency.

Best way to convince yourself on all of this is to set up the X1M and another radio on dummy
loads and experiment.

Mark,
I am not sure what is going on in the X1M either. However, I do want to point out a common difference between typical ham transceivers and military gear.
The mil HF backpack transceivers I have played with (PRC-104 and some RACAL stuff) do cw, as you say, in USB mode. An audio tone is injected into the balanced modulator, yielding a cw signal which is offset from the indicated “dial frequency” by some amount. The PRC104 used 1kHz, if I remember correctly. A received signal on that same frequency, beat against the same carrier oscillator, yielded the same audio tone. If you check the radio with a freq counter, however, if the “dial frequency” was 7040.000 kHz, the freq counter would tell you your signal was actually on 7041.000 kHz
With typical ham gear, however, the cw signal is generated by keying the SSB carrier oscillator, so your radiated signal is actually ON the “dial freq.” In receive mode the BFO is offset from that carrier freq to provide an audible beat note. So. the PRC104 set at 7040 and the ham gear set to 7041 would be on the same frequency, which you could verify by listening with a third radio or measuring both transmitted signals with a freq counter. Both techniques work; I prefer the ham way of doing things- the radio transmits where it says it is, without my doing a “mental offset.” The mil rig technique takes a bit of getting used to when operating on a scheduled net or QSO freq.
I believe the X1M now operates as I describe above for a typical ham rig. With the cw BFO set equal to the IF Offset, when I key the rig in cw it emits a signal on the dial frequency, and a received signal on that frequency (as verified externally) produces an audible beat note equal to the “cw tone” setting. It does not matter what radio is in use at the other end. The only drawback here is that the SSB filter is too broad to filter out the “audio image,” meaning that you can receive a cw signal when it is both above and below the BFO freq. A narrower cw filter (W4OP is working on it!) will cure that.
I hope this helps.
Ken, W1KRT

On Dec 22, 2013, at 7:21 PM, <pal350@...> <pal350@...> wrote:

My current parameters are:

IF: 8999554
LSB: 8998450
USB: 9000652
CW: 8998754
CW TONE: 800
DDS CLK: 32768
DDS MLT: 1

I didn't mess with the last two at all.

In my particular X1M these parameters make USB and LSB sound almost
exactly the same when listening to noise, and WWV is within a few Hz on
both sidebands. The crystal filter in each radio will be a little different.

As for setting up CW, it's important to actually understand what the developers are doing with the radio. Here's what I THINK is going on.

The X1M Pro schematic is not easy to read, and there's no theory I can find. But the only places I could find "CW TONE" were on a line coming out of the microprocessor on page 3, and one going into the audio output stages at lower right on page 6.

It appeared to me that the CW TONE adjustment does not affect any RF frequency determining stages. I'm guessing it adjusts the frequency of an audio oscillator implemented in firmware to give the user sidetone while operating CW.

As an example, say I set both my PRC-1099 packset and my X1M to 7.040 MHz. Using the settings above, I can have a CW QSO with myself, and the RX audio out at both ends is 800 Hz.

Then without changing any other settings, I changed the CW TONE to 1800. Result was I still heard an 800 Hz tone in both receivers, but the TRANSMIT CW SIDETONE in the X1M was now 1800 Hz.

I further tested my theory by setting the CW BFO value equal to the IF OFFSET value. This results in the generated carrier going right down the center of the X1M IF and then out the radio dead on the indicated frequency of 7.040. I hear a zero beat in the PRC-1099, which is listening on USB to a straight sine wave carrier coming in at the bottom of the filter (basically getting suppressed, although it's so strong I can hear some crud getting through). Obviously, that won't do.

By moving the CW BFO setting DOWN 800 Hz (which DOES affect an RF oscillator somewhere), the result is a sine wave carrier at 7.040.800. This moves the carrier up 800 Hz in the (USB) filter passband of the PRC-1099 receiver, resulting in a demodulated 800 Hz tone.

An aside on how the PRC-1099 generates CW. When I hit the CW key on the 1099, it applies an 800 Hz audio tone to the balanced modulator, ultimately resulting in a carrier transmitted at 7.040.800. The X1M presents that as an 800 Hz tone in its audio output.

Just for grins, I set CW BFO to 800 Hz ABOVE the IF setting. Yep, that gives me an 800 Hz audio tone on the 1099 audio, but with the mode set to LSB. The mil standard is CW on USB, to prevent exactly this kind of getting wrapped around the axle, so I set it back.

The totally bizarre thing (until I understand it) is this: while in CW mode as I adjust the CW TONE setting up and down, I can hear the timbre of the X1M audio output change. It's highest at 2000, lowest at 800 then starts going high again until 200, which is as low as the setting goes. It's sounds like the setting is actually messing with the bandwidth of the audio output stages. This happens only in CW mode. It may be what is confusing people into thinking the setting is affecting RF stages. I could be all wet on this, but it sure matches what I see.

So the answer to the question, "How do I set up CW in the X1M" is actually, "It depends on what you want." My choice is to set up the radio so it can talk to any milspec HF pack set, all (or most all) of which send CW in USB mode. If they have special CW filters they are basically just narrower USB filters So set the radio up to put out a sine wave at 800 Hz above the indicated frequency. That means setting the CW BFO 800Hz below the IF setting.

With these settings I know any SSB radio listening in USB mode will hear my CW at 800 Hz. I also know with the X1M set to CW mode, I'll hear any radio that derives its CW by injecting an 800 Hz tone into its balanced modulator in USB mode.

You may want to set up CW differently. The important thing is to realize that the CW BFO setting is the one that actually affects your X1M's actual transmit freek's relation to the indicated
freek. Setting the CW BFO setting equal to the IF setting will transmit a carrier dead on your indicated frequency.

Best way to convince yourself on all of this is to set up the X1M and another radio on dummy
loads and experiment.

Subject: [X1M_QRP-Transceiver] ROLL YOUR OWN FILTERS

I have just uploaded to the main group page a couple of pages of information from the RSGB , for those of you that wish to operate the X1M on bands other than those covered by the internal filters. It is in the Mods and Reviews section.

These are QRP filters, designed for 10 watts .

They are 7 element low pass filters and are inserted between the transmitter and antenna.

A nice clean and simple layout and certainly recommended when operating on frequencies outside of those covered by the internal filters. Never hurts to be a good neighbor , and gives you any of the bands that you might want.

If any of you are new to winding toroids, they are simple to do. I usually have at least one project every day that involves one or more filter. One caution EACH TIME you just run a wire through the core is ONE turn.

If you need any help , plenty available here on this great group. ENJOY some new bands with your rig !!

IF you need values for the experimental bands, I can provide you with a nice link for those also.

Someone good with ExpressPCB , might want to design a blank board, that we could order in bulk, if there was enough interest. I have a couple of good scans that I could send you of the boards that I regularly use.

Ken,

You're right on ALL. If you set up the X1M with the CW BFO = IF, you'll xmit your sig right on the indicated dial freek. If someone at the other end has his radio set up the same way both of you will hear zero beats on both LSB and USB. So the next thing you'd both do is move the RIT to get the received tone you want.

I've been messing with mil sets so long, I'd forgotten the ricebox standard. :)

My reasoning is if I set up the X1M CW per my previous post, I have the best shot at running CW with both "standards" without confusion when I say "Let's meet on XXXX KHz."

In the final analysis, if you know what your radio is doing you'll set up right to talk to the other guy.

I goofed -- Ken W4OP pointed out correctly that CW TONE changes the pitch of a received CW signal. I must've been messing with the setting while in USB or LSB.

So I admit to being pretty confused about the developers intentions. If someone can figure out a definitive description of what's going on here, I'd be interested. :)

At this point I can only say that my set is working the way I want it to - it's xmitting 800Hz above the indicated (display) freek. If tell a friend with a PRC-74, PRC-1099, SC-130, PRC-2000, PRC-138 or a variety of other mil sets that use the CW-on-USB convention, we'll be able to talk Morse with both radios showing the exact agreed-upon freek.

Mark,
Please don’t use the term “rice-box standard.” My Elecrafts (K1, K2, and K3) and every TenTec radio I have owned
and used in the past fifty years, as well as the Icoms, Yaesu, etc operated the same way- your transmitted cw signal
was on the indicated dial frequency. By the way, not all mil rigs are the same. I believe the ‘104 used a 1000 Hz offset;
you say your '1099 uses 800 Hz. So, if you and another green-box friend agree on a “dial freq” you may not end up on
the same frequency even though your freq readouts agree. But hey, whatever works for you. There are reasons the
green rigs work the way they do. “Our” way is an outgrowth of history - back when we all had separate receivers
(usually with a variable BFO) and transmitters, and the only logical thing was for your transmitter to tell you the
actual transmit frequency. That still makes the most sense to me. Do it how you prefer, but please remember that
offset when looking for a non-green-radio net, or a calling freq such as 7030 or 14060.
Have fun, and enjoy the holidays!
73,
Ken, W1KRT

If you are sure your mic is actually working correctly, maybe you have the same problem I found on mine. My mic plug needs to be pulled OUT about 1 or 2 mm for the audio part of the plug to make contact. My permanent solution was to crazy glue a small thin washer onto the plug, right up against the fat part of the plug. This cured my problem, now 100% audio when I PTT.

3124. Poor quality mic jack fix

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-24 00:23:31 UTC
From: <disklog@...>
Topic: 3124 Message: 3124

Today my mic jack failed and no wiggling would help it. I removed it from the radio and took a photo. (If I can upload the photos) You can see in the pic that it is a very poor quality jack. The 3 metal pieces are slid into channels with a curved contact point dipping into the plug tunnel. The contact material is tin and does not have much in the way of springiness. I tried bending the contact piece into the tunnel but it bends back up.
I have not found a quality replacement jack that will fit in the space allocated. If anyone cares to help search that would be appreciated. I suspect that we all will sustain this failure eventually due to the strain of the mic cord on the audio contact.
MY FIX:
1. I used a pin and wicked crazy glue into the plastic side channels that hold the metal pieces. This prevents the metal from sliding up the channel.
2. I placed some solder into the curved contact piece and also used solder to reinforce the metal.
No idea how long this fix will last.
These are really bad jacks. Would love to find something better. Failing that, having some identical replacement jacks would be helpful.
Ken N2LZV

3125. Mic jack Photos .....

3126. Re: [X1M_QRP-Transceiver] New Firmware

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-24 03:08:19 UTC
From: Charlie , W5COV
Topic: 3117 Message: 3126

Has anyone, especially a good old hard core CW operator installed the new firmware ? If so I wonder what your observations and results were.

I am not sure who, where, or why, 800 Hz. was chosen as an offset problem.

Was it a decision by the company on their own to change some operating parameter ?

If so it would be interesting to know a little bit about the history and the decision. I wasn't aware of an issue with that.

It is VERY cool in the radio room/lab tonight, so I have not braved it to do the upgrade and see if I can readily observe any changes, especially in the way to do the CW setup on the radio.

We are also in the single digit temperatures and they continue to drop. I expect we will be below zero tonight, with a north wind. My lab is the furthest north room on my home and requires a bit of supplemental air conditioning. However while it has been sometimes cool even cold at 31 degrees F below zero, I never have got around to adding any supplemental heat. As I get older, or the weather seems cooler each year in there, it is certainly on the list before next winter :)

Besides my antennas are VERY heavily iced over, so there would be no getting on the air to try some contacts to see if there is a difference in the CW operation. Hopefully in a few days, when the antennas thaw out, they will also survive and not require work in the middle of the Winter :) I was happy with the current version that I am running.

Curious minds want to know .

THANKS !!
Charlie, W5COV

Hi Heinz,

Which group of the X1M Pro do you own ? Is it one from this latest
current run, or have you owned it a while ?

The CW filter is still in the development stage and is not yet available.

The AGC / SMD kit works on all models. There is a bit of difference in
the models so that will determine which mods you may have to make.

AGC kits are available from me and are $12 for USA stations and $14 for
DX stations. My PayPal information is cvest@... (cvestATcox.net)

Hi Charlie,

tx for ur answer. My machine is one of the latest. Got it 6 weeks ago (Firmware 1.021usa)
i, ll buy both AGC and CW-Filter (without there is not really cw available:-) u know what i mean.
please show me the way to pay via paypal :-)

the adress i found in one post did,nt work.

So, first we all here from my fam. wish u very happy xmas and the best for 2014.
same to all the other guy,s here.

While I have not done an in depth analysis of the upgrade, I do see that CW SPLIT now functions properly.
Version # reports the same V1.021 but the date is now Dec 21 on the Firmware page.
If others have more time please do the upgrade and report any bugs.

Merry Christmas,

Dale W4OP

Hello Dale and Charlie,

Just thought I'd let you know AGC installed and working with the absence of any discernable heat or smoke. (so far)

All appears well and briefly monitoring a net consisting of VK3's, 5's and 7's, the audio is much more constant that pre AGC where I used to have to change the volume constantly, so I guess I should surmise that it is working and doing what it is designed to do.

Thank you Dale for your efforts and thank you Charlie for your encouragement and enthusiasm.

Now for the S Meter!!

CONGRATULATIONS Mike !! Actually it is no small feat for someone new to doing this.

Hopefully this will just be the beginning for you of enjoying building kits and other circuits.

Dale is working very hard, in his spare time, which he has precious little of, on another great accessory for the X1M, especially if you work CW.

You might also want to consider adding the 9 MHz. notch filter too.

If you do enjoy things like what you just did , you might consider getting you a cheap breadbaord and power supply off of eBay. Less than $10 total, but a lifetime of fun. I use mine almost every day and I know Dale uses his regularly also.

Here is a page by a friend of mine, that offers a wide variety of hobbyist electronic projects that are easy to build, inexpensive, and actually serve a useful purpose when you are done. www.techlib.com . Also be sure to check his Circuits link to more projects .

Best 73, Charlie, W5COV

Hey Ian,

I saw on NORAD earlier that Santa Claus had indeed made it to Australia already :) Paul Ross, our author and editor in chief of the Manual for the X1M has covered the SignaLink USB and easy ways to use it for the X1M in several messages, and I "think" that he even has some photos.

Check message 2665 , he gives a lot of detail in which other radio uses the same configuration and does a good job of covering the SignaLink and X1M. You can find some other posts by Paul on the subject if you search the message archive. I used the keyword SignaLink . I also have one here and have used it with the X1M for testing. I probably just used the same settings that Paul did, Alinco DX-SR8 .

If you have any problems let us know.

You are in for a LOT of new fun , if you haven't used many of the digital modes before.

Great to hear you have the AGC installed and working !!

Simply, for the SignaLink USB interface.

Jumper audio/headphone from X1M to "AUX" jack on SLUSB. Use a stereo jumper.

Fabricate cable for microphone -- cut an RJ-45 cable in half. You need two grounds (PTT, Mic), Mic, and PTT. See User's Guide for pin out. You need a 3.5 mm stereo plug.

Configure jumpers (4) in SLUSB to match wires chosen in previous step (I use an Alinco DX-SR8 with same SLUSB, so use that choice).

Connect to computer, and select the sound card that the SLUSB represents.

Control is with a SECOND cable -- the one from Wouxun.us works fine.

Configure software for ICOM 718

That is it.

GM All,

I have a slightly different take on interfacing and jumpering in the SLUSB. Since I have a 'big rig' that I have the Signal Link already set for, I just made an adapter cable that goes from RJ-45 jack on the back of the SLUSB to the mic and speaker jacks of the X1M. That way you can simply change the cable plugged in to the SLUSB to change rigs.

ONE WORD OF CAUTION: Make sure you know which way the RJ-45 jack is wired up in your Signal Link! Assuming the wrong way can cause you a lot of hair pulling, etc. Been there and done that. :-(

Hi Dave,
I don't see a difference in Memory functions. It has always been possible to store a frequency/mode in Memory. What we had asked for was the ability to retrieve a Memory channel into one of the VFO's so we could tune. This would allow for Memory channels to serve as a quick bandswitch. My X1M with the new software still does not allow me to dump a Memory channel into a VFO and tune with it. Maybe I am missing a step or procedure?

Tnx,

3152. Securing Final Transistor NUT (no epoxy)

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-25 23:42:54 UTC
From: <disklog@...>
Topic: 3152 Message: 3152

I have uploaded my latest method of securing the final transistor nut so that the radio can be serviced without hassles with the final transistor nut. I noticed the circuit has an unmasked area above the final transistor. It looked to me that there may have been a prior way of better securing the nut/transistor that was eventually abandoned.
First I discarded the stainless steel nut and bolt that comes with the radio and replaced it with an ordinary steel nut and bolt. This change allows the nut to be soldered.
I cut a strip of brass 5mm wide, and drilled a clearance hole in the brass. then tinned the brass with solder and tinned the new nut. Soldered the nut to the brass and shaped the brass to fit in the mounting hole. Then I secured the transistor with the nut and brass and checked the fit. Then I marked the brass for trimming and bending. After removing, trimming and bending to mate to the circuit board, I then reinstalled and tightened securely. After the assembly was correctly securing the transistor, I wicked solder under the brass "wings" to secure it all to the circuit board.
Now the screw can be removed and the transistor serviced without any problems with the nut or shield assembly.

Hi Ken,
Does this allow the transistor to connect to the metal sheet and cabinet- which serves as a large heat sink? If not, and I have not done any thermal studies, but I question whether the transistor stays cool enough for long term survivability. I just cannot tell from the photos.

Tnx,

Hi folks,

Just wanted to note that this attachment system will NOT work for the original X1Ms that use a bipolar transistor in the final - the emitter must be insulated from ground, as it has some emitter resistors.

Here is an event for ALL of us to use the X1M in the CW mode, and become familiar with how this radio handles this mode.

I don't believe I have ever missed even one of these events, even though one year, just home from one of my hospital stays I think I only made 1, possibly 2 contacts and even I was ashamed of my CW, but the operator(s) stuck with me and we did indeed confirm a contact. So DO NOT be AFRAID to give it a try.

Other times I have made in excess of 50 contacts, setting out looking for the person sending the slowest or with an obvious lack of proficiency, and also the very weak stations, in case they were QRP. I wanted those people to make at least one contact too.

This is NOT a contest. It is an event that has been around since the very early days of ham radio.

For by far and away the VAST majority of the contacts by me was using a Heathkit DX-60 and my ORIGINAL NOVICE receiver, that I got used prior to 1965, It is a Hallicrafters S-40 . Yes I do normally go QRO with about 50 watts output on this one night. I will make an exception this year and use my X1M.

I still use my original J-38 straight key also, that has literally thousands of hours on it , just since I have owned it in the early 1960's and it was a used military surplus key when I got it.

Can someone suggest a couple of frequencies away from the main busy frequencies where we can all look for other X1M users and make it in the part of the band that all classes of licenses for those bands can operate?

I think maybe one on 40 and one on 20 .

Here is the time and date from the ARRL :
Straight Key Night is held every*January 1*from 0000 UTC through 2359 UTC

Hi folks,

Just wanted to note that this attachment system will NOT
work for the
original X1Ms that use a bipolar transistor in the final -
the emitter
must be insulated from ground, as it has some emitter
resistors.

Yes Dale, if one reads the description carefully, the soldering is only done after the mosfet is securely attached. After attachment then the solder wicking takes place. In fact, the final bending and trimming is only done after an initial attachment is made where one marks the brass for cutting and bending.
Once bend and cut, you fasten the mosfet securely making sure the brass wings are actually a hair ABOVE the circuit board. This insures no upward pressure is being placed on the mosfet and it is tight against the bottom tin plate and case. Then the solder is wicked under the wings and all is well.
I suspect the factory had some similar attachment gizmo that proved too expensive or time consuming for production.

[X1M_QRP-Transceiver] Securing

Final Transistor NUT (no epoxy)

I have uploaded my latest method of securing the final transistor nut so
that the radio can be serviced without hassles with the final transistor nut.
I noticed the circuit has an unmasked area above the final transistor. It
looked to me that there may have been a prior way of better securing the
nut/transistor that was eventually abandoned.
First I discarded the
stainless steel nut and bolt that comes with the radio and replaced it with an
ordinary steel nut and bolt. This change allows the nut to be soldered.
I
cut a strip of brass 5mm wide, and drilled a clearance hole in the brass. then
tinned the brass with solder and tinned the new nut.
Soldered the nut to the
brass and shaped the brass to fit in the mounting hole.
Then I secured the
transistor with the nut and brass and checked the fit. Then I marked the
brass for trimming and bending. After removing, trimming and bending to mate
to the circuit board, I then reinstalled and tightened securely. Aft er the
assembly was correctly securing the transistor, I wicked solder under the
brass "wings" to secure it all to the circuit board.
Now the screw can be
removed and the transistor serviced without any problems with the nut or
shield assembly.

I would like to have the ability to set the radio up for CW split with the receiving VFO in the appropriate LSB/USB and the transmitting VFO obviously in CW. Additionally, since I've upgraded to the Nov firmware (not the newest) I noticed my mute button doesn't work on the internal speaker or headphones. Does anybody else have this problem? Mike N1SPZ

3165. X1M Pro with new firmware changes TX frequency with CW?

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-26 04:06:19 UTC
From: <jamespwithrow@...>
Topic: 3165 Message: 3165

All -

I'm using an X1M Pro with the latest firmware installed (Dec. 23rd). The radio works great for digital modes, etc. but I've run into a problem with CW. I have a straight key connected as per the manual, keyer set to "M".

While transmitting into a dummy load (my CW skills aren't up to par just yet), the CW transmit frequency will suddenly shift by an amount equal to the "CW Tone" menu setting, as verified by a local receiver. I've tried this at both 750 and 800 Hz, and on 40 and 20 Meters to see if it was frequency-dependent. Doesn't seem to make much difference.

When the shift happens, it will sometimes last for a couple elements, other times it will continue until the rig goes back into receive and transmits again.

If I transmit while in the settings menu, the first instant of each element seems to be at the shifted frequency, but the rest of the dit or dah is at the proper frequency (i.e. although there is a shift at the beginning of the element, the rest of it seems to be at the proper frequency).

In case it's necessary, my menu settings are as follows:

IF OFST: 8999550
LSB BFO: 8998450
USB BFO: 9000650
CW BFO: 8999550
CW TONE: 750/800

Wondering if anyone else has seen this issue or has any thoughts?

Hi Jim,
With your CW Tone set to 800Hz (and CW BFO=IF OFFSET) , the TX frequency should always be the frequency indicated by the digital readout. Your RX frequency will differ by the tone setting. This allows you to listen to a station using your tone setting. The other station will be doing the same, using his tone setting. Thus no RIT is needed and you won't be walking one another up and down the band. The X1M now does this correctly. If your rig is behaving differently, try reloading the software. I have not seen this issue since it was first fixed in the November version.

Dale -

I've reloaded the software and the rig is now behaving normally.

The strange thing is that I was able to reload the November firmware, which didn't exhibit the issue. When I reloaded the December firmware, the issue was back. I turned the rig off, then on again and it went away. I then re-reloaded the December firmware and haven't been able to get it to fail yet.

Thanks for the answer! This little rig has been a lot of fun!

Hello to all X1M-Fans,

I think Ihave my personal solution for using the X1M in the 475-kHz-Band.
With help by Tonne-Software (tnx) I designed a Diplexer to avoid intermodulation.
The resulting power on MF is about 25 mW, the rest of nearly 4.5 W has to be absorbed
in the high-pass branch of the diplexer.
In the attachements you will see:
- the schematic of the diplexer,
- a photo of the built diplexer,
- the high-pass frequenxy response,
- the low-pass freququency response
- a narrow spectrum and
- a wide spectrum.

I hope that helps the MF-fans.

Betreff: Re: [X1M_QRP-Transceiver] Re: X1M pro LF/MF TX Test [4 Attachments]

Hi MF-Fans,

in the meantime I've built a simple low-pass-filter for 475 khz.
as the first part of a diplexer. In the attachment there are some jpgs of the
filter-response, the analyzer-results and the filter itself.
similar to Joe I measured about 20mW on 475 kHz.
But I think it is worth to follow this path. Maybe a steeper filter could suppres the 1st harmonic more than the 40dB as it is now.
Amplification is not the problem, hi

In receive mode as well as in transmit mode there ONLY is bandpath filtering when operating within those 5 small amateur band segments. Outside the bands in and output signals only are passing two low pass filters with an Fo at about 30 MHz.
>>After tuning the X1M to e.g. 475Khz, i found its main DDS to operate around 9475 KHz. When in transmission mode this should result in TWO output signals. One is around 9475-9000 = 475Khz and the second one around 9475+9000 = 18475KHz! Because outside those 5 band segments there is no band pass filtering at all and LPF surpression only will be for frequencys above 30 MHz, both signals must be available at TX output! So under NO circumstances any 'out of those 5 bands' transmission should be made without adding some sort of external filtering. Of course this also concerns the use of other Amateur Bands like e.g. 160m, 30m, 17m aso.
>>When operating 'out of bands', also attached power meters will be influenced by more than one signal. This means, also its readings can be expected to be quite inaccurate.

I agree. That was partly my point in posting it.
Any feelings on my split request?

Hi friends, I noticed, after update new firmware, I lost first dot at the bigginig of TX. And now, I am again AA1CEX instead of UA1CEX. I listened up and down of my freq. But first dot disapeared forever!

73/72 - Victor, UA1CEX.

Dave:
Sorry for my absence from the board. Anyway, thanks for the offer to test the X1M but, don't bother. I moved my X1M to an XP Machine and it is working very well. I have discovered many Win7 issues with all kinds of Ham Radio Programs. It seems that Microsoft abandon some drivers, just dropped them or the applications/drivers developers didn't revise them for Win7. I just got tired of all of the issues surrounding Win7 so I'm back on an older but working computer :-(

Joseph,

If you would like I can drag my X1M and cable to work where the computer runs W7 Enterprise and see if I get the BSOD or other nasty reactions. I have FLDIGI installed there also.

When I first plugged the interface cable in my machine at home it assigned it Com port 6. My regular installation uses Com Port 1 for control of my TS-2000. Info transfer seems very fast.

>David:
>Thanks for the suggestions. I can live with the delay issue but the Blue Screen is a real hassle. I tried un-installing HRD and the driver. Reloaded and the problem.. I'm beginning to think that it has more to do with Win7. I've had issues with other Ham Radio Applications and after doing some research the root problem had to do with the drivers, or lack of for Win7. I never had issues with XP. I do have another PC with XP but it older and not anywhere as near as robust as my Win7 Machine. I did try to use FLDIGI and can't seem to get it to talk to the serial port. Any thanks again for the assistance!

>>I have a stable (normally) working Win 7 PC. I bought the X1M Programming Cable and it doesn't seem to function very well. I purchased and I'm still awaiting the new "Pro" Panel. In the mean time, I've been using the XM1 with HRD and the performance is very poor. When attempting to change frequencies, HRD almost always hesitates which is really frustrating! Eventually after running for a few minutes, HRD will either lock up or the computer will "blue screen" because of this, I'm concerned about using this set up to update my firmware with my Win 7 PC. Is there anyone out there who have had similar issues? I have attempted various port settings including flow control, speed, etc. to no avail. Any input would be appreciated.

Victor you are the second person to report a similar problem. (At least I believe that was the problem, I'll review the messages from yesterday. It is too early in the morning for me here :)

I am not sure of the exact problem but it appears that it might be in writing to the EEPROM.

His solution and this is by no means a good answer, was he loaded one version back and then reloaded the latest version and had no problems as I have heard of yet after doing a downgrade and rewriting the upgrade.

I have not been able to duplicate it here yet.

Mike, I haven't had a lot of time to play with this last upgrade, only having done my main radio last night. I will need to look at the diagram also, unless you have already traced it out. I am thinking we may be out of room for changes.
We have really pushed this radio from using minimal to using up to the maximum memory for "upgrade space" since the radio was first introduced.

3179. MR>VFO function

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-26 16:16:48 UTC
From: <ed@...>
Topic: 3179 Message: 3179

I have contacted the factory about including this function again. This time I mentioned replacing the MUTE function with the MR>VFO function. They say they will do this. I can only assume that it will be in a firmware update. I'll let you know as soon as I get anything.

As far as the recent firmware updating comments goes..... I believe that early on, someone mentioned that they had to turn the radio on/off a couple times before some correction seemed to take place. I run the update one time and then check the firmware version to make sure it has installed. Maybe it would be a good idea to run the install twice? I don't see where it could hurt anything. Then cycle the radio on/off a couple times and hope for the best.

3181. Replacement Front Panels

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-26 16:19:21 UTC
From: <ed@...>
Topic: 3181 Message: 3181

Two items of interest to purchasers of the latest radios and those that bought front panels to upgrade the X1M to X1m-Pro.

The factory is aware of the misspelling of "Transceiver" and has promised to send me corrected replacements. For the upgrade displays, I did not notice that the front panel was missing the clear plastic screen when I shipped them out. After this was brought to my attention, I informed the factory and they will send new ones.

I will ship out the replacement items when they arrive.

From: Charlie , W5COV
Topic: 3179 Message: 3182

I ran into the same problem Ed with our first upgrade and everything was fine, because somewhere in the literature there is a note about this possibly happening on the EEPROM write, so I see no problem in doing a second install. That could have been me that made that comment early on, until I located that information on "possible" minor problems on an update.

THANK YOU !! GREAT NEWS !!! I thought they just needed a function spot to implement the M>V upgrade and somehow I never even gave MUTE a thought, since it was a pain to me :) so I tried to just ignore it. Now it will find a VERY useful function !!

Looks like I spoke too soon.. the problem is back again this morning.

I'll do some digging and see if there is anything reproducible about the issue.

Charlie,
I received my new AGC board and installed it. Finally I have a working AGC. Thank you for your quick shipping. It took three tries, but this time all is well.

G’day Joe,

What version of W7 are you having issues with? (W7 Home, W7 Pro etc.)

The professional version of W7 has an inbuilt XP “component” which, from memory has to be “unlocked” but once done, you can run any W7 incompatible programs exactly as they would run in XP.

This is not available in the home edition.

You just navigate to the program using “My Computer”, right click on the program and choose the Compatibility option… worth a try if you have W7 pro.

Subject: Re: [X1M_QRP-Transceiver] Programming Cable and Blue Screen of Death

Dave:

Sorry for my absence from the board. Anyway, thanks for the offer to test the X1M but, don't bother. I moved my X1M to an XP Machine and it is working very well. I have discovered many Win7 issues with all kinds of Ham Radio Programs. It seems that Microsoft abandon some drivers, just dropped them or the applications/drivers developers didn't revise them for Win7. I just got tired of all of the issues surrounding Win7 so I'm back on an older but working computer :-(

Subject: Re: [X1M_QRP-Transceiver] Programming Cable and Blue Screen of Death

Joseph,

If you would like I can drag my X1M and cable to work where the computer runs W7 Enterprise and see if I get the BSOD or other nasty reactions. I have FLDIGI installed there also.

When I first plugged the interface cable in my machine at home it assigned it Com port 6. My regular installation uses Com Port 1 for control of my TS-2000. Info transfer seems very fast.

David:

Thanks for the suggestions. I can live with the delay issue but the Blue Screen is a real hassle. I tried un-installing HRD and the driver. Reloaded and the problem.. I'm beginning to think that it has more to do with Win7. I've had issues with other Ham Radio Applications and after doing some research the root problem had to do with the drivers, or lack of for Win7. I never had issues with XP. I do have another PC with XP but it older and not anywhere as near as robust as my Win7 Machine. I did try to use FLDIGI and can't seem to get it to talk to the serial port. Any thanks again for the assistance!

Subject: Re: [X1M_QRP-Transceiver] Programming Cable and Blue Screen of Death

GM Joe,

I don't know if this will give you any insight or not. I bought the programming cable with the X1M.

My computer uses XP and I don't use HRD but I have tried rig / computer control running FLDIGI. With my setup, there seems to be a second or two delay between stimulus and response either way the command goes. (rig>computer or computer>rig) It seems like it may be an X1M thing more than a programing cable thing. :-)

3186. X1M Pro with flrig

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-26 22:11:10 UTC
From: <k4tql@...>
Topic: 3186 Message: 3186

I have an original X1M upgraded to the X1M Pro using the panel kit. As far as I can tell, the upgrade went well.

I using Ubuntu 12.10, 32 bit, and am attempting to communicate with the X1M using flrig. I am using the usb serial cable obtained from import communications as the comm link between the PC and the X1M.

I cannot get flrig to talk to the X1M. Linux has the proper USB driver installed and the serial port shows up as /dev/ttyUSB0. The problem appears to be a baud rate problem .

Question 1: Has anyone successfully used flrig to control the X1M?

Question 2: What serial port parameters should the PC serial port be set to?

Question 3: What are the serial port parameters of the X1M. I know that it does work because I used windows to do the firmware upgrade. The PC is the same one I use for linux (dual boot). I know the serial cable works (used for firmware upgrade). Is the baud rate for the X1M adaptive or do you need to set the PC serial port to some value in order to communicate.

Hoping someone has an answer.

3187. Re: Replacement Front Panels

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-26 22:24:34 UTC
From: Bruce Nebergall K4TQL
Topic: 3181 Message: 3187

Thanks Ed. I noticed the lack of the plastic screen but was so excited that I didn't notice the mispelling of Transceiver.

A tip for those installing the panels. I found that it was easy to mis-align the rectangular pushbuttons so that they would bind in the front panel. What I did was to install the screen assembly so that both the voltume control and the frequency control were positioned properly. I made sure that the case top was installed. I test fit the front panel so that the control shafts were properly positioned (they can move a little). Then I test fit the pushbuttons on the circuit board carrier and inserted them into the front panel. Then I test fit that assembly to the front of the case holding the case vertical so that the buttons hung down. I made sure each button was free. Then, I removed the front panel and removed the barriers on the adhesive pads on the new display module. Then holding the case vertically, I reinstalled the front panel/pushbutton assembly on the front of the case again making sure the buttons were free.

A lot of steps, maybe, but all the buttons are free with no hanging.

Bruce, K4TQL

Greetings guys,

Brought the X1M with me to my parents house in Houston, TX for Christmas visit. Threw a end-fed antenna up into a pine tree and worked 40,20,and 17 Meters. Had a half-hour QSO with my buddy in Southern IL (QRP to QRP). Then I worked Delaware, Oklahoma, MO, FL, IN, OH, and a local-net station about 80 miles south of Houston. It still amazes what you can do with 5-watts, speaker-wire, tuner, and a tall tree :-) It was a fun!

Regards, John KC9YAW.

From: <disklog@...>
Topic: 3192 Message: 3192

It is 1 am EST Friday morning. I have just completed building the RF meter board and the S meter board. I installed them both inside the X1M and am happy to report they play together nicely. No problems and no issues. It was a tight fit but both boards fit inside the radio with only the positive signal wire having to be brought out to the meter.
If desired, the spare pin on the DB9 can be used for the meter wire and ground picked up where convenient.
I will add 2 photos to my version 3 folder to show where I installed these boards.

Hi,
The XYL and I live on a boat which we cruise the US West Coast on. I was semi active as a Ham and SWL'er years back and then quit a dozen years ago. I was looking for a cheap, portable SWL radio (to connect to my lap top) to use for weatherfax. I'd also like to get a cheap HF xcvr to play with (mostly 20 meters). So I thought I might just get an MFJ 9420. Long story short, did some web searching and found the X1M, which I hope will give me (almost) everything I'm looking for: all band receiver for weatherfax and 20m QRP xcvr.

Got a couple questions:

Any way to get the X1M to receive AM signals? So I can listen to SWL stations or voice weather broadcasts?

Any mounting brackets available for this? I might want to mount this through a dash. Anyone doing this?

Should I get the X1M Pro or wait for the Mark II?

Thanks and 73's

Paul

3199. X1M holiday ops

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-27 16:09:41 UTC
From: <pal350@...>
Topic: 3199 Message: 3199

Been using my X1M over the holidaze at my parents'. I keep a G5RV stashed there of this type...

http://www.hamuniverse.com/g5rv.html

...it's the version fed with 300-ohm twin lead. I brought the Norcal BLT tuner originally, the new version of which is here:

http://www.qrpkits.com/blt_plus.html

The BLT tuner works well at 40m and higher, but the toroid in the z-match doesn't have enough oomph to tune 80. So I ordered an Emtech ZM-2 kit...

http://emtech.steadynet.com/zm2.shtml

...and put it together. It tunes 80 great and also gives a flat match anywhere I go on 40, 20, 15, or 10.

However, results are disappointing outside the filtered bands, and the antenna or tuner are definitely not the culprits. For instance, at 7.300.000 the system will tune to 1:1, as indicated by a very sharp minimum on the LED brightness and confirmed by an SWR reading. But if I move to 7.300.001, I hear the filter relay click and I can't get a match. The LED null is there but much less pronounced and the SWR is pretty high, maybe 3:1.

I pretty sure what's happening is without the filter, junk from the P.A. is confusing the tuner, which can't match to several freeks at the same time. Clearly, moving 1 Hz shouldn't cause the tuning situation to change that drastically.

Kinda using this example to re-amplify my request for the developers to turn on the closest filter no matter where you are in the 100KHz to 30MHz range. I can't think of any way it could hurt performance but I there are certainly ways it could help.

80m Filter Fo = 3.9MHz
enable from 100KHz to 4.000.000MHz
(Also mod filter components to increase Fo to 4.0MHz if feasible)

40m Filter Fo = 7.15MHz
enable from 4.000.001MHz to 7.300.000MHz
(Also mod filter components to increase Fo to 7.3MHz if feasible)

20m Filter Fo=14.4MHz
enable from 7.300.001MHz to 14.400.000MHz

15m Filter Fo=21.45MHz
enable from 14.400.001MHz to 21.450.000MHz

10m Filter Fo=29.7MHz
enable from 21.450.001MHz to 30.000.000Mhz

This firmware mod should be do-able without using any extra PROM space since I'm guessing it will involve only changing five data constants.

My on-air friends are unanimous - the X1M audio is in desperate need of some serious processing. My first project on getting home will be to look into a VOGAD circuit for the audio, maybe taken from the one used in the PRC-1099. Goal will be to cut off anything below 300Hz and apply a heavy dose of VOGAD processing.

I use USB to listen to AM signals and it sounds good to me.
I had a MFJ 9420 for years, I added a digital display to it and it worked well. However, the X1MPRO runs circles around it. Much more radio for the money, and if you like to tinker, you can make it you favorite rig.
Not aware of any mounting brackets for it, but it is so small that mounting should not be an issue. There are 8 Allen head bolts with plenty of extra thread available to allow fabrication of a custom mount.
The Mark ll is pie in the sky, a long way off and is expected to be fairly expensive. Not at all in the price range of the X1MPRO. If you are looking for a bit more power, there are several options. A 20 watt amp is available from an on line seller, as well as more powerful amps. My favorite is the easy to build ARRL homebrew challenge winner amplifier. It is cheap to build, I get 60 watts out, and it uses two 98 cent transistors.
Hope this helps,
Ken N2LZV

Yes Ken it was a blast. I'm using the Hendricks SOTA Tuner and I'm still experimenting with antenna length and turns ratio on the tuner.
I have not found an ideal combination yet. I have cut two antennas. One is for 40M and the other is for 20M. The tuner will tune the 40M antenna on 20, but not quite as low a swr as the one cut for 20. I used the 20M antenna as a vertical om 17M and it worked pretty good. The 40M did a very good job as a sloper on 40. Since I'm still experimenting I will hold off on giving the dimensions. I'm considering a different toroid for the tuner at this point. The issue that I have right now is that the swr's tune great on 40 but not so good on the higher bands. Have you or anyone else on the forum found a winning combination? If and when I get something that I'm truly happy with I will post the details to the group.
Regards, Rick. AKA John.

Tnx Ken. Great info. I am a tinkerer of sorts but, because we live on a boat, have limited access to tools. I've got a low watt soldering iron, "beginner" soldering skills and old eyes. ;) Do you have links for the amps you mentioned? If there's a simple kit I might be able to handle that. I'm on a limited budget as this will be a "toy" in the eyes of the XYL. I'm also eyeing that AGC mod people have mentioned here.

The dash where I'd like to mount this is about 9" wide x 5.5" high x 9" deep. I'd like to mount the X1M, speaker and antenna tuner there if possible. There's room in the back for a small-ish power amp also. I'm undecided about what to use for an antenna. I've used Ham Sticks with great success in the past but this boat already has insulators on the backstay so I might use that instead.

Any suggestions for a tuner I can face mount like the X1M?

Rick,
Thanks for the reply. I currently use an MFJ-945E tuner. It seems to tune well & has a meter but it is a little bigger than I would like. Probably the best solution for me would be a homebrew version of the MFJ tuner,
made as small as possible. I suspect if someone produced a very small tuner with a small cross needle meter, rated at about 20 watts or so, it would sell well.
I am not fond of the tuners that use an LED as an indicator.
I am thinking of trying the PAR end fed dipole that covers 10/20/40. It might make a good antenna for the go box.

Yes Ken it was a blast. I'm using the
Hendricks SOTA Tuner and I'm still experimenting with
antenna length and turns ratio on the tuner.
I have not found an ideal combination yet. I have cut two
antennas. One is for 40M and the other is for 20M. The tuner
will tune the 40M antenna on 20, but not quite as low a swr
as the one cut for 20. I used the 20M antenna as a vertical
om 17M and it worked pretty good. The 40M did a very good
job as a sloper on 40. Since I'm still experimenting I will
hold off on giving the dimensions. I'm considering a
different toroid for the tuner at this point. The issue that
I have right now is that the swr's tune great on 40 but not
so good on the higher bands. Have you or anyone else on the
forum found a winning combination? If and when I get
something that I'm truly happy with I will post the details
to the group. Regards, Rick. AKA John.

Hi Gang,
With my work schedule, the CW filter is months away. To date I have designed and built the basic filter- 4 pole 500Hz. Real world filter is a near perfect match to the synthesis/simulation. But I still need to build IN/OUT matching, try it on the radio. Develop the necessary digital interface so it will auto switch when CW mode is selected, layout the SMD board and get ready to kit.
Sorry for the delay, but I do 80+ hour weeks just keeping up.

My suggestion is to type "20 watt hf amp" into google.
It will take you to several sites some all homebrew and some kits. There is also a yahoo group that is dedicated to these small amps.
I am not aware of any front mountable tuners, but I am no expert in that area.
If you are looking for the easiest construction of an amp, then I suggest you build one that uses mitsubishi mosfets, particularly the RD16HHF1 mosfet.
If you are a ARRL member, you can read online the construction of the homebrew challenge amp and decide for yourself if it is something you can build. The worst part of homebrew construction is sourcing all the parts, which makes kitbuilding so attractive.
Good luck,
Ken N2LZV

Tnx Ken. Great info. I am a tinkerer of sorts
but, because we live on a boat, have limited access to
tools. I've got a low watt soldering iron,
"beginner" soldering skills and old eyes. ;)
 Do you have links for the amps you mentioned? If
there's a simple kit I might be able to handle that.
 I'm on a limited budget as this will be a
"toy" in the eyes of the XYL. I'm also
eyeing that AGC mod people have mentioned here.
The
dash where I'd like to mount this is about 9" wide
x 5.5" high x 9" deep. I'd like to mount
the X1M, speaker and antenna tuner there if possible.
 There's room in the back for a small-ish power amp
also. I'm undecided about what to use for an
antenna. I've used Ham Sticks with great success
in the past but this boat already has insulators on the
backstay so I might use that instead.
Any
suggestions for a tuner I can face mount like the X1M?

Hi Group,

The Mark II is like someone said "pie in the sky." The last time frame I saw for even a "possible" BETA prototype was roughly 2 years out. The price is rumored to be in the range of Elecraft OR higher !! At least double the X1M.

I do listen to AM with the X1M.

There are no mounting brackets available that I am aware of. But this is a great radio , and an even greater radio for the guy that likes to roll up his sleeves and play. You can make it anything you want it in a custom installation or configuration with a little building, or use it right out of the box, maybe tweak your offsets a few Hertz and you are ready to operate !!

This is maybe the best support group on the entire net for a radio. Plus LOTS of guys who build accessories and share them with the group on the home page.

If you are looking for an amplifier kit there is one advertised by two retired hams that I believe are in Texas, and while I do not own the amp can tell you that they produce nothing but a very limited line of ham accessories of TOP QUALITY and at good prices. (Usual no financial interest) However the QST amp is as cheap and simple as you can find.

Dale runs a full time HIGHLY successful business (www.parelectronics.com) and we are fortunate that he is so willing to give up his FAMILY & FREE time to work on projects for the X1M. Dale developed the AGC (TINY) 0805 SMD KIT , that I do kit and sell , FOR FULL DISCLOSURE.

He works on the CW filter when he has the time and he is VERY particular about the QUALITY of whatever product he works on whether it is for sale or to share with us. It is no overnight or even 1 month development project and he will end up with hundreds of hours of his time and probably into the hundred dollars range in just test parts and configurations to develop the best possible filter, and then he offers it to us at a price where he is not making any money. We ARE a SMALL market currently, even in the QRP subset of hams and this is a special item for a TINY radio. I would use the external filter that Ed at Import Communications sells as a CW filter (also can be used for SSB) until such time as Dale has PLENTY of time , up to a year , to work on a special X1M filter. You can always use the external filter that Ed sells,(www.importcommunications.com) with another radio later, or sell it. It appears to be a close copy of the NESCAF filter.(Again no financial interest)

Ken , another group member found a different output transistor that is a drop in replacement for the new X1M PROS's that use a MOSFET final, that gives a couple of more watts output.

There are a couple of inside the microphone speech processors , made by Lee/7 and Lee/9 on the group home page.

We always enjoy seeing new ideas and builds. Some of us keep a breadboard with the radio,just to try different things.

It is a fine, fun , radio and you are only limited by your imagination as to what you want it to be.

I use mine all of the time and have an absolute ball with it. LOTS of DX worked !! I don't even give it a thought that it is a QRP rig !! If I hear someone I want to work, I jump in just like I would running QRO and 9 out of 10 times I will work them.

Hope this answers some questions. ALL opinions are my own. Just enjoy the radio. This radio is absolutely amazing in not only size and performance, but with all of the little extras included for operating, that I have never seen available on ANY radio or kit in the economy class !!

This is a nice little tuner with a high/low range…great for the X1M on low with the option of using with an ext amp to 200W…coax or open wire feed…not too expensive and size good. Crossed needles an additional bonus.

The X1M I had ordered some time ago finally arrived... right before the start of the Christmas season. Too busy spending traveling and with family to get the radio on the air other than some quick scanning of the bands.

This afternoon I erected a Buddipole tuned for the 20M band, listened around for awhile, and found a nice strong station. I waited for the stations to sign off and reached out with the X1M's blistering 4.5 watt signal.

Had a nice USB QSO with a fellow Ham nearly 1000 miles away. He was taken aback that I was using a radio about the size of a paperback book and transmitting less than 5 watts. Nice report of 5/6, 5/7 and great audio. What fun!

Next up... CW... just as soon as I've finished learning the code!

Topic: 3214 Message: 3214

I got one of the new batches of X1m with the intention of SOTA activations so after I got all my equipment squared away, batteries, a par end fedz antenna, etc, I tried to activate a local summit here in Colorado a couple of days ago. I was rushed so I didn't have time to really set things up right but I should have been okay. Couldn't make any contacts even self-spotting on sotawatch but I figured I must have just had something misconfigured.

Today I set up my antenna, radio, etc in the back yard in what I'd call ideal conditions. I called cq and tried to answer cqs off and on for 4 hours and couldn't reach anyone. I tried my regular dipole that's set up over my house and couldn't reach anyone. Finally, frustrated, I came inside and turned my FT-450D down to 5 watts and made a contact with one of the local hams immediately. He said he'd help me out trying to test this so I switched back to the x1m and he said he could barely hear me and that if he hadn't been expecting my call, he wouldn't have heard me, I was down in the noise really bad. I tried opening the mic up in case that was interfering with my voice getting to the electret element and he said I was still barely readable but my FT-450D with 5 watts was okay... so now I'm feeling pretty disappointed. The dipole I'm using I know has good swr across 20m so it's not an swr issue. Honestly, I'm at a loss. I couldn't make a single contact and now I'm worried the radio is not putting out it's full rated power or I'm overlooking something else important that I should be paying attention to. I don't have a wattmeter but I've emailed a couple of local hams who may be able to help there. I'm putting about 11.8v into the radio.

Anyone have any advice/pointers/things to check?

3215. Re: [X1M_QRP-Transceiver] Bad day with the radio

Topic: 3214 Message: 3215

Every ham should have a wattmeter and VSWR meter. 11.8 is quite low for the rig- I believe most of us are running 13.2 or a bit higher. Get an accurate low power wattmeter (preferably PEP) and check your power out. It is likely you will need to adjust the mic gain pot.

Marcus, Yes a watt meter is needed and Dale is the right person to answer the question. You can for a quick and temporary test is to listen to the X1M on your other radio and CAREFULLY TWEAK the microphone gain control inside the top cover. Some have an EXTREMELY sharp and pronounced "sweet spot". Likely this will take care of your issue. Use a dummy load and be careful not to overload the front end on your other radio.

Hi Charlie,

I listened to the X1m running off the end fedz with my FT450d and it sounded fine. I don't know if more gain would have helped but I guess I should play with it. I'm seeing about a wattmeter.

Can I run this radio off 14.8v or do I need to keep it under 14? I'm trying to find the right batteries. I've got 2 3s lipo batteries but I guess they're not providing enough voltage. Nominal voltage is 11.1 but they charge up to around 12.5 so that's where they are when I start using them. They dropped to about 11.8 while messing about today.

Thanks,
M

Marcus, I would not recommend going over 14 volts with it. One reason, the radio runs pretty warm anyway.

There are a lot of wal warts out there for computers these days that will handle the 2 amps required. I am running mine off of an old Motorola linear wal wart that was part of a 12 volt rack charging station, and it handles the radio very well.

Is it is a battery voltage 14.8 volts that you are talking about in the field ? There are quite a few options to drop and or regulate the voltage if you need to. I won't say the radio wouldn't handle the 14.8 volts, but I just do not think it is a good idea with this particular radio.

Charlie

I can get LiFePo batteries that float at 13.2 volts. I guess that's how I'll go and I'll sell these LiPo batteries on craigslist or something. Thanks for the input. I've never used a radio where every volt and tiny bit of swr, gain, etc, mattered. I've always had 100+ watts to play with so this is all new territory for me.

Thanks again,

M

I may not have been as clear as I should have been. Although it was a 12 volt charging station the wal wart actually puts out 13.2 volts DC .

From: Charlie , W5COV
Topic: 3214 Message: 3222

The radio is not as critical as perhaps I made it sound. QRP and portable are all about those little things. I believe the final transistor is rated up to 20:1 SWR, the regulators could likely handle even 14.8 volts input. The gain is ALWAYS important for peak to peak and average power using SSB QRP , no matter the radio.

QRP once you try it and see just how much success you can have with QRP , you will see where you want to save every microamp of draw from the batteries , especially if you are carrying your equipment. You want the most efficient antenna possible to transfer every microwatt into ERP. Battery field life, weight, antennas, become even more important in the field.

The radio is plenty rugged enough for any QRP work, we are just passing along years of experience in being just as successful on QRP as you are on QRO.

In fact the vast majority of the guys on here are using their rigs as their rig in the shack.I use the same antennas ,tuner, power supply, etc. in the shack for all of my radios. But I don't have to be concerned with the amount of time I can stay in the field or if I have the best most lightweight antenna possible. My X1M is replacing a Yaesu FT-707S TRUE QRP model and I treat them both the same. The FT-707S is just a bit heavy to be dragging out to where I would run battery power.

When on VERY rare occasions I go to the field today using QRP, I want to work as many stations as possible and be able to have plenty of battery to last as long as I want to operate.

From: <captpaul1@...>
Topic: 3197 Message: 3223

I've got a (stupid) question regarding tuners, how do you tune a tuner without an SWR meter? I noticed almost all the smaller, cheaper tuners don't have meters. How do you use them?

Right now I'm debating whether to just get a 20m ham stick antenna and the smallest SWR meter I can find, or use the backstay antenna and one of the tuners suggested here. I've had very good success with ham sticks on boats in the past, but suspect that backstay might work even better.

Paul,

Most of the tuners without meters have a LED in them that you tune until it goes out or a dim as you can get it. I find they work very good. I have tuned my little SOTA tuner that I purchased from Hendricks kits until the LED was out or dim and then checked against a accurate SWR meter and fount it to be right on. Sure is nice not to have it drag another piece of equipment on the trail.

Just want to wish everyone a safe, healthy and prosperous New Year and have fun with your new X1M if you have it or waiting for it to arrive.

Thanks to Ed, Dale, Charlie, Paul and a handful of others out there for their support and ongoing question and answer periods from new folks who join this list.

I am awaiting the new face plate for my original X1M and getting it up to Platinum status.

Bands tonight (Friday night eastern, Saturday z) are the pits.40 meters has very heavy QSB.

Last night down to -28c with windchill and tonight sitting at -2c and nice evening.

All the best in 2014 to all.

3227. Of Tuner LEDs and Meters

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-28 04:28:45 UTC
From: <pal350@...>
Topic: 3227 Message: 3227

For those who prefer wiggling meters to LEDs in their tuners,something occurred to me. The LEDs on the BLT, ZM-2, and other similar tuners is driven by RF rectified by (usually) a common small-signal diode.in series with a resistor around 1K. You could substitute a meter for the LED and boost the resistor to whatever value would keep the meter from pranging when the tuner is way off-resonance. Then you would tune for minimum meter reading.

Or you could connect the meter across the LED and have both. I like the LED because you can see it at night and it's pretty much the simplest possible indicator.

The N7VE LED SWR Indicator/Bridge circuit is one of those amazingly useful, yet elegant and simple circuits that comes along once in a great while and makes you bop yourself up-side your head and ask, "Why didn't I think of that?" Eight components for a combined dummy load and SWR indicator.

When the LED goes out, you know by definition you are delivering maximum energy to the antenna.

BTW, when the tuner is tuned to resonance but the bridge is left in the circuit (by leaving the TUNE-OPERATE switch in the TUNE position) , the power is reduced by a factor of four. So the X1M's 5W would be reduced to 1.25W. If you have your FT-817 all the way down at 0.5W, you could knock it down to 125mW.

This might come in handy when conditions get really good and you get embroiled in one of those "how low can we go" contests.

Paul,

While he X1M is a fine rudimentary rig for the money it is still a work in progress. It does not have AGC.

I'd recommend getting a rig from the more established vendors like ICOM (IC-718, IC-7200) or Yaesu (FT-857, FT-897).

I like the IC-7200 form cruising because the heat sink fan is external to the electronics so there is less of a chance of salt-spray corossion to the electronic components.

Subject: [X1M_QRP-Transceiver] Should I get a X1M?

Hi,
The XYL and I live on a boat which we cruise the US West Coast on. I was semi active as a Ham and SWL'er years back and then quit a dozen years ago. I was looking for a cheap, portable SWL radio (to connect to my lap top) to use for weatherfax. I'd also like to get a cheap HF xcvr to play with (mostly 20 meters). So I thought I might just get an MFJ 9420. Long story short, did some web searching and found the X1M, which I hope will give me (almost) everything I'm looking for: all band receiver for weatherfax and 20m QRP xcvr.

That VSWR circuit was first published in the ARRL Handbook in the 1960's. It is nothing more than a Wheatstone bridge which goes back to the mid 19th century.. At balance no current flows through the detector. Back then we used either grain of wheat incandescent lamps or a tiny meter (I still have some of the meters- commonly used as battery level indicators in high end transistor radios of the era). So what N7VE added was the LED as the indicator.
So, nothing really new. If built out of SMD resistors on 50 Ohm microstrip, they are usable into the low GHz range.

Hello all,

Is there any way a complete novice with virtually no equipment (a multimeter, a CRO and a home brew grid dip oscillator) can generate and measure a 50µV signal to get an approximate one point calibration for ken□s S Meter, or will it require me to visit my local radio Tech to get it done?

I thought of hooking another Tx into my antenna , tuning to a reasonably stable signal, and using the reading from that to set the same value on Ken□s S Meter, but I sold my other HF radio to pay for the X1M and I can□t think of any other way to produce a 50µV signal.

Subject: Re: [X1M_QRP-Transceiver] S Meter scale

Dale,
I tried to calibrate the S meter using my HP signal generator. I used 100uv for S9 in my unit. I used USB on the radio and AM on the generator. I had to tune the radio off frequency and listen for the loudest AM squeal. I then adjusted the S meter for 100uv at S9. I tried other ways to calibrate but tuning the AM off frequency seemed to correspond to strong SSB reception. 50uv for S9 and 100uv for S9 are both standards still used today. The 100uv setting appeared to work better for the X1M.
Please keep in mind that this is audio derived AGC and the S readings and can best be described as "approximate" .

[X1M_QRP-Transceiver] S Meter
scale

Hello,

I have uploaded a pdf
into the files section of a printable
scale for an S-Meter.

It is sized to suit the
common (in Australia) µA
panel meters that are 58mm wide x 52mm high, but can
be printed to suit
any sized meter using the % enlarge/reduce function of
most
printers.

I took the scaling from
information from the ever reliable
Wikipedia so hopefully it will be correct. Just
print it to a label and
stick it to the face of your meter after checking the
edges of the scale match
the edges of the scale on the meter.

Ian,
I'll have to thing a while on how you can easily generate a calibration signal (if possible). Let me point out that from my experiments with this audio derived agc/S meter, 50uv was way to small a value. I ended up using 100uv from my generator. Maybe someone else can suggest a reason for this but at 50uv the meter seemed way too sensitive.

Ian,
The more I think about this the harder it gets. Keep in mind your calibration signal needs to be modulated for the agc board to generate a dc voltage.
Since your email I have been fooling around with a small Radio Shack AM transistor radio. I attached a 6 inch whip to the X1M & tuned it to 2.1mhz on USB. I then tuned the am radio until a loud squeal was heard from the X1M. I was able to generate a signal from the am radio oscillator but it pinned the meter. I was going to use a measured distance from the X1M to reduce the carrier until S9 was shown on the meter. But logic stopped me because this method just has too many variables.
Sorry I am not much help here.

Tnx Joel.

@Mike - If I had the money (or rather, if I had the OK fm the XYL) I'd get an IC 706 MKII or the IC 718. Had a 706 on my last boat and with just Ham Sticks it did everything I could ask of it. This time around, what I really need is just a simple SWL receiver for weatherfax, but what I'm doing is stretching the budget a tad to get myself an inexpensive xcvr instead.

3234. calibration signal source

One inexpensive tool to have on bench is a signal generator calibrated for S9 and S1 on several bands. Over the years many QRP groups have offered kits and I believe Elecraft has commercial version. I have Ruling Pig, Steve Weber and maybe a few other versions on bench. This with a simple rf voltage sniffer are some of my goto tools on bench. Do Google search and you may still be able to find an inexpensive kit. One of mine has crystal controlled oscillators tuned for QRP cw frequency on 4 bands, I believe it was a flying pigs 4 days in may project kit.
I am away from home so I cannot get to bench for more details.
The third inexpensive tool is a simple frequency meter with LCD display this was also a 4 days in may project kit.

Understood.

Have you considered a used rig? When ICOM discontinued the IC-703 HF QRP (not the IC-703+ HF plus 6m). They were selling new for around $350 dollars. You may find a good deal on a IC-703.

I had a IC-706 MK11 and like it but the receive current consumption was high, greater than 1 amp. That is why I got a Yaesu FT-897 which has half the receive current consumption of the IC-706.

You may also get a good deal on the Yaesu Ft-817 QRP radio but keep in mind the VHF band stops at 154 Mhz so it will not cover the 156-157 VHF Marine band.

@Mike - If I had the money (or rather, if I had the OK fm the XYL) I'd get an IC 706 MKII or the IC 718. Had a 706 on my last boat and with just Ham Sticks it did everything I could ask of it. This time around, what I really need is just a simple SWL receiver for weatherfax, but what I'm doing is stretching the budget a tad to get myself an inexpensive xcvr instead.

From: <disklog@...>
Topic: 3237 Message: 3237

This morning I came up with an idea for a simple calibration source for the s meter. I have a Fox brand crystal oscillator on 15.0mhz. As many know these are tiny metal cans with a crystal and oscillator components built in. Just add 5v and ground and it generates a nice 15mhz signal.
My thought it to put this on a perfboard with sufficient attenuation to output an S9 signal. Built into a metal box it may do the job we need.
This could be a community signal source which could be returned to me when calibration is completed.
The device would be very small and light to allow cheap shipping worldwide.
Any thoughts on this idea?

i agree with Mike A. , look for a good used one, Eham.net, Ebay, even Cragislist, (avoid scammers), Everyone else chime in on sources to help this Sailor . Look up reviews on Eham.net and other sites, there are good ones at decent prices this time of the year, bills mount up etc . for all of us . Good luck and enjoy , AJ

Ken, I have several of those canned oscillators for different frequencies. I KNOW I have enough 50 MHz. ones to supply for free probably everyone that would want one and perhaps use a 4060 or some other counter to do some dividing. I'll try to check my supply and frequencies today and send it to you. They wouldn't all be calibrated to the same standard, like your idea, but perhaps it will add to the projects that they can build and then calibrate their own personal oscillator from your master .

Just a thought. I do get some surplus parts in quantity and others I just have a supply of for building. But if anyone ever does need a part even some obscure ones I might have a spare, at no cost. The 50 MHz. modules are an example of some I have in quantity.

Another solution to a nice homebrew sig gen is an N3ZI DDS VFO:
http://www.pongrance.com/super-dds.html

These are really cheap and put out a constant 250mV P-P into 1K. A simple T pad takes it to 50 Ohms followed by a MMIC and you have a nice lab sig gen.

Yes Doug offers some very nice well refined DDS-VFO's. He has a TON of experience with them, producing them as long as I can remember them being available. He has some other nice quality kits too, even digital displays for old boat anchors.

I own a couple of DDS-VFO's from Doug and have one on each workbench to use for testing. My personal experience is he makes a good kit and supports it well too. Plus he accommodates we 600 meter people:)

Yes that is a good solution and would add a useful piece of gear for those that lack test equipment.
My thought was the folks on here that are not too technical, could just connect a 9v battery, and connect my gizmo to their radio and calibrate. For those that will only need it one time, I figured this might be a useful shared item.
But, if one is inclined at all to get more involved in this hobby, I agree with Dale, invest what you can in test devices because you will surely need them eventually.

Ken , your idea has a lot of merit and I expect several will take advantage of it. Many of the people using the X1M do not have a lot of test equipment, so it is a great idea to provide them with a source for calibration.

I too have to go along with you and Dale on getting at least some basic test equipment. There are some pretty decent buys on pretty darned accurate capacitor, resistor,transistor, inductor, etc. assembled tester modules on eBay. I have a couple of them that I keep handy for quick tests. You do have to pay attention to the tolerances for whatever your personal use is for the testers.

One item to be aware of on the IC703 is that some of the main boards had issues that caused a chirp on CW. Icom would not step up and fix them. Their only answer was to purchase a new main board. So, if buying a used 703, make sure to ask if it performs properly on CW.

Dale, I understand your T pad comment but need a little more info about what you mean by the MMIC. Is this a "Monolithic Microwave Integrated Circuit"? Still on the learning curve...

BTW, I saw this today http://kd1jv.qrpradio.com/XMEGA/XMEGA.htm http://kd1jv.qrpradio.com/XMEGA/XMEGA.htm and ordered the evaluation board ($30). I have a few of the cheap ebay AD9850 modules so I figured I would make another DDS VFO for the bench. Total cost $35 and a couple buttons/ rotary encoder from the junk box. The free, open-source software has lots of "radio-ready" features.

Yes, Likely there are several mfg out there. Mini Circuits makes the MAR, MAV and ZFL line. These are tiny 50 Ohm in/50 Ohm out devices that only need a series resistor/choke and DC blocking caps to form a gain stage. Choosing a device then comes down to gain/ freq response and IP3 performance.

As a reminder, and just a suggestion, can posters sign their call with their mail so we can keep everyone straight and get to know new members?

3250. Replacement Final in ver.2 radios

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-29 01:01:10 UTC
From: <r-mason@...>
Topic: 3250 Message: 3250

I thought it would be agood idea to have a spare final for my ver.2 radio, so looked at the usual places I buy parts.......no one lists the 2SC1971. Seems there are a few on eBay, but after reading much discussion about fakes appearing on the market there, I started looking for a crossover. The NTE342 is listed as a replacement, but seems no one has those either. Production ended some years ago.

Any suggestions on a reliable source for the original Mitsubishi 2SC1971, or is there a better substitute?

Roger N4HSI

3251. RE: [X1M_QRP-Transceiver] S Meter scale

Topic: 3041 Message: 3251

Ian,

Today I built up a small prototype calibration device for calibrating the S meter.
It appears at this stage that I will be able to provide switchable 50uv or 100uv output on this device.
The calibration method will be:
1. Choose 50uv or 100uv output.

2. Tune the radio to 15.000 mhz.
3. Place the radio into the CW mode.
4. With nothing connected to the radio Zero the S meter.

5. Attach a 9v battery to the battery clip.
6. Connect the calibration unit BNC to the radio antenna connector.
7. Adjust the S meter sensitivity to read S9.
8. Check meter Zero with no signal to the radio.
9. Recheck S adjustment for S9.
10. Remove battery from calibration unit.
11. Send the unit to the next person that needs it.
This is a small unit and shipping hopefully will be inexpensive.
Let me know if you are interested in using this device.
Ken N2LZV

Hi Roger,
Please confirm you have the non- pro version of the X1M as that uses the 2SC1971. The PRO version uses RD06HVF1
RF Parts should carry the 2SC1971

Most definitely Ken,

and more than happy to pay for any associated postage and handling costs. Of course, sending it to me will mean it will be out of circulation for more than just a few days although if it is small and lightweight, air freight is a possibility

I really appreciate the work you've done and the offer to share.

Subject: RE: [X1M_QRP-Transceiver] S Meter scale

Ian,

Today I built up a small prototype calibration device for calibrating the S meter.

It appears at this stage that I will be able to provide switchable 50uv or 100uv output on this device.

The calibration method will be:

1. Choose 50uv or 100uv output.

2. Tune the radio to 15.000 mhz.

3. Place the radio into the CW mode.

4. With nothing connected to the radio Zero the S meter.

5. Attach a 9v battery to the battery clip.

6. Connect the calibration unit BNC to the radio antenna connector.

7. Adjust the S meter sensitivity to read S9.

8. Check meter Zero with no signal to the radio.

9. Recheck S adjustment for S9.

10. Remove battery from calibration unit.

11. Send the unit to the next person that needs it.

This is a small unit and shipping hopefully will be inexpensive.

Let me know if you are interested in using this device.

Ken N2LZV

Wow Ken! That’s service.

I’ll check QRZ and let you know. I prefer PO box but will need to check QRZ.

On my way out the door…I produce a radio program on air every fortnight . starts in <1hr so must rush. Get back to you as soon as I can

Have a listen if you like jazz http://www.947thepulse.com

I too was thrilled when Ian gave me a shout out the first time I
listened to his program. Amazing an FM station on another continent !!

I saw Dudley on TV after he got so ill and I could barely tell he was
even the same person that I had enjoyed and laughed at for so long.

From: ua1cex@...
Topic: 3041 Message: 3262

Hi friends. I reinstalled firmware. Now, first dot appeared again. But, when I calling CQ, and give a pause for 2-3sec, my freq, goes down for about 300-400hz down. It is crazy situation.

73/72 - Victor, UA1CEX.

I too was thrilled when Ian gave me a shout out the first time I
listened to his program. Amazing an FM station on another continent !!

I saw Dudley on TV after he got so ill and I could barely tell he was
even the same person that I had enjoyed and laughed at for so long.

3264. Homebrew S meter Calibrator Available

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-29 07:13:24 UTC
From: <disklog@...>
Topic: 3264 Message: 3264

For anyone that needs it, my homebrew S meter calibrator is built and available to be used by those that lack the proper equipment to complete S meter calibration. It is NOT fancy and was built using the "dead bug" style of construction. Not a pretty way to build but excellent for RF devices.
I am asking that anyone who needs it, please email me directly and provide your name and shipping address. Once your calibration is complete, I ask you to email me and I will provide the next name on the list. You then mail it to that person.
Please don't request this unit until you have a properly working AGC board and S meter board installed in your radio.
I will provide the easy instructions to the first builder and ask that he/she pass the instructions along to the next person. If everyone is considerate of the other members, this will be a successful project for all.
Please email me with any question or concerns you may have.
73,
Ken N2LZV

Mike,
I don't have the components to build another unit, but if you have your radio all ready to go, then give me your name, call and address and I will get this item to you. If you don't have a ready radio, then give me your info when all is ready.

Topic: 3250 Message: 3269

I contacted Eleflow about their version of the 2SC1971 and received a nice reply from their sales manager (on a Sunday !)

If anyone else is interested in a spare final for the ver.2 radios, and we can get together an order for 10 or more pieces, the total per piece cost will be $10 (via PayPal) which includes shipping across the pond and US postage to get it to you. DX shipping is certainly possible but will be a bit more depending on the destination. UK and EU may find it just as economical to order directly from Eleflow.

I will place the order if there is enough interest. Let me know.

3272. Netting on CW

Yahoo group: X1M_QRP-Transceiver (2013)

From: <k4tql@...>
Topic: 3272 Message: 3272

Nearly every CW net requires you to zero beat the NCS. Can anyone tell me how to do that with the X1M. Now, I've learned that the transmitted signal on CW will be on the frequency indicated by the digital readout. But, the NCS will almost never be exactly on the assigned net frequency and some of them run filters so narrow that you only have to be off by a few hundred Hertz so as to be unreadable. Hence, the requirement that you zero beat the NCS. Yet I've found no way to do that with the X1M alone. Is there a spotting function on the X1M that I've missed?

Bruce, K4TQL

Hi Bruce,
The manual explains how to do this. But it is identical to evry modern transceiver.
Firsts et up the CW BFO= IF OFFSET in the menu. Then choose your CW Tone.
When tuning a station in, tune them on the low frequency side of zero beat until their received tone matches what you selected for CW Tone.
That's all there is to it.
The only difference here is that currently, the X1M hears both sides of zero beat (as does a DC RX). So just be sure to tune the station you wish to contact on the low side of zerobeat.

73,

Dale W4OP

Thanks Dale. I'd already planned that but it takes a pretty good ear to match the sidetone to the received tone. Of course, you could quickly key the rig to see if it is close but then you're transmitting on top of the NCS. It would be nice to have a "spot" function where you're actually listening to the tranmit frequency instead of the offset frequency.

Good tip about coming up from the low side. I missed that.

"I used to live on a boat. Use the back stay. Icom has an atu specifically for outdoor/marine.
Sell it to the xyl as safety not a toy."

For safety, the best piece of radio gear to have is a 406 EPIRB. We don't leave port without one. Second to that would be a marine VHF, which we also have. Weather Fax, which only requires a decent SSB receiver, it also something that is very important for extended trips off shore. I could get a Tecsun PL660 for $100 that would work. Marine HF SSB is something every commercial ship is required to have, but honestly, almost no one uses. Nope, getting a Ham rig is purely for fun. Had an Icon 706 Mk II aboard the last time we went cruising. It was very nice to be able to check in with the maritime nets on 20m every day, mostly to keep our families updated on our progress. It was also great fun to work DX while anchored in some remote spot. But I would never rely on a Ham radio to save my butt in the event of a real emergency.

Sorry for the off topic remarks, but as someone who has spent my entire adult life at sea (both for work and pleasure) I have an opinion on topics like this. ;)

G’day Joe,

What version of W7 are you having issues with? (W7 Home, W7 Pro etc.)

The professional version of W7 has an inbuilt XP “component” which, from memory has to be “unlocked” but once done, you can run any W7 incompatible programs exactly as they would run in XP.

This is not available in the home edition.

You just navigate to the program using “My Computer”, right click on the program and choose the Compatibility option… worth a try if you have W7 pro.

Subject: Re: [X1M_QRP-Transceiver] Programming Cable and Blue Screen of Death

Dave:
Sorry for my absence from the board. Anyway, thanks for the offer to test the X1M but, don't bother. I moved my X1M to an XP Machine and it is working very well. I have discovered many Win7 issues with all kinds of Ham Radio Programs. It seems that Microsoft abandon some drivers, just dropped them or the applications/drivers developers didn't revise them for Win7. I just got tired of all of the issues surrounding Win7 so I'm back on an older but working computer :-(

Subject: Re: [X1M_QRP-Transceiver] Programming Cable and Blue Screen of Death

Joseph,

If you would like I can drag my X1M and cable to work where the computer runs W7 Enterprise and see if I get the BSOD or other nasty reactions. I have FLDIGI installed there also.

When I first plugged the interface cable in my machine at home it assigned it Com port 6. My regular installation uses Com Port 1 for control of my TS-2000. Info transfer seems very fast.

David:
Thanks for the suggestions. I can live with the delay issue but the Blue Screen is a real hassle. I tried un-installing HRD and the driver. Reloaded and the problem.. I'm beginning to think that it has more to do with Win7. I've had issues with other Ham Radio Applications and after doing some research the root problem had to do with the drivers, or lack of for Win7. I never had issues with XP. I do have another PC with XP but it older and not anywhere as near as robust as my Win7 Machine. I did try to use FLDIGI and can't seem to get it to talk to the serial port. Any thanks again for the assistance!

GM Joe,

I don't know if this will give you any insight or not. I bought the programming cable with the X1M.

My computer uses XP and I don't use HRD but I have tried rig / computer control running FLDIGI. With my setup, there seems to be a second or two delay between stimulus and response either way the command goes. (rig>computer or computer>rig) It seems like it may be an X1M thing more than a programing cable thing. :-)

Dave K3GAU
On Wed, Dec 18, 2013 at 9:07 AM, Joseph Westbrook <k7zt@...> wrote:

I have a stable (normally) working Win 7 PC. I bought the X1M Programming Cable and it doesn't seem to function very well. I purchased and I'm still awaiting the new "Pro" Panel. In the mean time, I've been using the XM1 with HRD and the performance is very poor. When attempting to change frequencies, HRD almost always hesitates which is really frustrating! Eventually after running for a few minutes, HRD will either lock up or the computer will "blue screen" because of this, I'm concerned about using this set up to update my firmware with my Win 7 PC. Is there anyone out there who have had similar

issues? I have attempted various port settings including flow control, speed, etc. to no avail. Any input would be appreciated.

Thanks,
K7ZT, Joe

Paul,
My comment about safety was a XYL jest. I assure you I don't need to be lectured on appropriate safety measures and realistic safety procedures. I can also tell you that my hobby in a remote marine environment would not depend on either of your choices.

> For safety, the best piece of radio gear to have is a 406 EPIRB. We don't leave port without one. Second to that would be a marine VHF, which we also have. Weather Fax, which only requires a decent SSB receiver, it also something that is very important for extended trips off shore. I could get a Tecsun PL660 for $100 that would work. Marine HF SSB is something every commercial ship is required to have, but honestly, almost no one uses. Nope, getting a Ham rig is purely for fun. Had an Icon 706 Mk II aboard the last time we went cruising. It was very nice to be able to check in with the maritime nets on 20m every day, mostly to keep our families updated on our progress. It was also great fun to work DX while anchored in some remote spot. But I would never rely on a Ham radio to save my butt in the event of a real emergency.

Hi Dale. When I start calling CQ on 14057,8, I did pause for 2sec, after that freq goes up to 14058,5. If I do again pause for 2sec. it goes back to 14057.8. And so all the time up and down. I can hear on another trcvr. X1M shows me only one freq and no shift.

Paul, while a great little radio for my use, it is not a one size fits all . Not everyone will find it fits their purpose.

However it has been interesting learning about you and I will now spend more time listening to the Maritime net.

Hopefully you will check in here on the group from time to time and let us know how life at sea is going and where you are. I personally look forward to working you one day, when you find the right radio, and learning more about your adventures.

Charlie, HERE,HERE ! I agree 100% , we would enjoy hearing about Sea Adventures, i was so close to living aboard so many years ago before i got motion sickness , i guess ear issues , used to dive a lot as well, still do when i get a chance, Sea life is so interesting and peaceful at times , lol. 73s

☐

I see the unwanted shift is 700Hz- that is why I asked. It might have shed some light into what is going on had the unwanted shift equalled your CW Tone setting.

Hi Dale. When I start calling CQ on 14057,8, I did pause for 2sec, after that freq goes up to 14058,5. If I do again pause for 2sec. it goes back to 14057.8. And so all the time up and down. I can hear on another trcvr. X1M shows me only one freq and no shift.

73/72 - Victor, UA1CEX.

Hi Victor,
Is it your TX, RX or both frequencies that go down? Does the display indicate the shift? Does it stay down?

Tnx,

I am listening too as usual.

Ian told me about it quite a while back and I have since
become a
jazz fan, and I don't listen to much music !!

Thank you from me also Ken for what you do and the
people you are
helping out.

This group is indeed fortunate to have such talent and
people
willing to share with others.

Ian:

Thank you for the response. I've been away from the board so sorry for taking so long to respond back to you. Anyway, my version of Win7 is the "Home" Addition. I did try to use compatible mode but, it failed. I've since abandon the Win7 PC for an older XP Machine. All is working well now accept not as much CPU/RAM which takes a hit when running HRD + PSK Software at the same time.

G’day Joe,

What version of W7 are you having issues with? (W7 Home, W7 Pro etc.)

The professional version of W7 has an inbuilt XP “component” which, from memory has to be “unlocked” but once done, you can run any W7 incompatible programs exactly as they would run in XP.

This is not available in the home edition.

You just navigate to the program using “My Computer”, right click on the program and choose the Compatibility option… worth a try if you have W7 pro.

Dave:

Sorry for my absence from the board. Anyway, thanks for the offer to test the X1M but, don't bother. I moved my X1M to an XP Machine and it is working very well. I have discovered many Win7 issues with all kinds of Ham Radio Programs. It seems that Microsoft abandon some drivers, just dropped them or the applications/drivers developers didn't revise them for Win7. I just got tired of all of the issues surrounding Win7 so I'm back on an older but working computer :-(

Subject: Re: [X1M_QRP-Transceiver] Programming Cable and Blue Screen of Death

Joseph,

If you would like I can drag my X1M and cable to work where the computer runs W7 Enterprise and see if I get the BSOD or other nasty reactions. I have FLDIGI installed there also.

When I first plugged the interface cable in my machine at home it assigned it Com port 6. My regular installation uses Com Port 1 for control of my TS-2000. Info transfer seems very fast.

Dave K3GAU

On Thu, Dec 19, 2013 at 2:51 PM, Joseph Westbrook <k7zt@att.net> wrote:

David:

Thanks for the suggestions. I can live with the delay issue but the Blue Screen is a real hassle. I tried un-installing HRD and the driver. Reloaded and the problem.. I'm beginning to think that it has more to do with Win7. I've had issues with other Ham Radio Applications and after doing some research the root problem had to do with the drivers, or lack of for Win7. I never had issues with XP. I do have another PC with XP but it older and not anywhere as near as robust as my Win7 Machine. I did try to use FLDIGI and can't seem to get it to talk to the serial port. Any thanks again for the assistance!

GM Joe,

I don't know if this will give you any insight or not. I bought the programming cable with the X1M.

My computer uses XP and I don't use HRD but I have tried rig / computer control running FLDIGI. With my setup, there seems to be a second or two delay between stimulus and response either way the command goes. (rig>computer or computer>rig) It seems like it may be an X1M thing more than a programing cable thing. :-)

Dave K3GAU

On Wed, Dec 18, 2013 at 9:07 AM, Joseph Westbrook <k7zt@...> wrote:

I have a stable (normally) working Win 7 PC. I bought the X1M Programming Cable and it doesn't seem to function very well. I purchased and I'm still awaiting the new "Pro" Panel. In the mean time, I've been using the XM1 with HRD and the performance is very poor. When attempting to change frequencies, HRD almost always hesitates which is really frustrating! Eventually after running for a few minutes, HRD will either lock up or the computer will "blue screen" because of this, I'm concerned about using this set up to update my firmware with my Win 7 PC. Is there anyone out there who have had similar issues? I have attempted various port settings including flow control, speed, etc. to no avail. Any input would be appreciated.

Thanks,

K7ZT, Joe

Topic: 3161 Message: 3299

Charlie,
I'm assuming the correct link is from wouxun.us, right?

3300. Re: [X1M_QRP-Transceiver] New firmware.

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-29 22:43:41 UTC
From: Charlie , W5COV
Topic: 3161 Message: 3300

Mike I am using the December 23 version from this link :
http://groups.yahoo.com/neo/groups/X1M_QRP-Transceiver/files/X1M%20Pro%20Firmware%20Updates/

I assume they are the same, since Ed provided them. I have it on my
radio and one that I also installed on an X1M for a friend and neither
of those radios exhibit any of these issues . I have tried to duplicate
them even running the radio for 24 continuous hours in different CW modes.

Charlie, W5COV

3301. Re: [X1M_QRP-Transceiver] New firmware.

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-29 22:54:45 UTC
From: mikejmardis@...
Topic: 3161 Message: 3301

Thanks. I'm not sure why I went through Ed's site but didn't have any issues.
I really hope to get to it tonight and will use the groups link since it worked for you.
I'm coming off a 34hr shift, so it may have to wait till tomorrow.
Mike

3302. X1M Micro

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-30 03:13:14 UTC
From: Dale Parfitt
Topic: 3302 Message: 3302

Hi Ken,
If your X1M is still open, I wonder if you would look at a couple of pins on U1B- the microprocessor.
In particular pin 38. I would like to know the voltage levels when in USB then LSB and then when CW mode are selected.

On pin 44, when in CW mode what are the voltage levels when in RX and then when the CW key is closed. Finally what are the levels on this pin when in SSB?

Thanks.

The micro is difficult to access behind the display as I remember.
However I can see which connectors they come out to going to the boards.

Dale,
Please help me understand what you are referring to. The chips I placed the heatsinks on are on the top board near the 1350. Where is the chip you are interested in?

Hi
Ken,
If your X1M is still open,
I wonder if you would
look at a
couple of pins on U1B- the
microprocessor.
In particular pin 38.
I
would like to know the
voltage levels when in USB then LSB and
then when CW
mode are
selected.

On pin 44, when in CW
mode
what are the
voltage levels when in RX and then when the CW
key is
closed. Finally what are
the levels on this pin when in
SSB?

Thanks.

Dale W4OP

Ian,

Today

I built up a small prototype calibration device

for

calibrating the S meter.It

appears at this stage that I
will
be able to provide

switchable 50uv or 100uv output on this

device.The

calibration method will be:1.

Choose 50uv or
100uv
output.

2. Tune the radio

to 15.000
mhz.3.

Place the
radio into the CW mode.4.

With nothing
connected to the radio Zero the
S meter.

5.

Attach a 9v
battery to the battery
clip.6.

Connect the calibration unit BNC to
the radio
antenna

connector.7.

Adjust the S met

er
sensitivity to
read S9. 8.

Check meter Zero with no signal to
the
radio.9.

Recheck S adjustment for S9.10.

Remove battery
from
calibration unit.11.

Send the unit to the next person that
needs
it.This

is a small unit and shipping hopefully will be

inexpensi

ve.Let

me know if you are interested in using this

device.Ken

Hi

Ken,

If your X1M is still open,

I wonder if you would

look at a

couple of pins on U1B- the

microprocessor.

In particular pin 38.

I

would like to know the

voltage levels when in USB then LSB and

then when CW

mode are

selected.

On pin 44, when in CW

mode

what are the

voltage levels when in RX and then when the CW

key is

closed. Finally what are

the levels on this pin when in

SSB?

Thanks.

Thats why there are so many connectors on the faceplate I think, and you can get to the lines at them . I KNOW , that I am NEVER going to replace one by soldering !! lol

BTW in the beginning I was going to make some extender boards and you just reminded me of that. A set would be really handy in some troubleshooting issues.

3310. Re: [X1M_QRP-Transceiver] New firmware.

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-30 04:50:43 UTC
From: <jamespwithrow@...>
Topic: 3161 Message: 3310

Dale and all -

I am using the firmware from the above link (the files section of this group). I haven't had much chance to play with the radio this week, but I have been able to determine at least on my rig what seems to trigger the issue. I am using a straight key, wired as per the instructions, with the keyer set to "M". If I send a character beginning with a dit and the dit is short enough, the rig will transmit at a frequency shifted downward by the amount of the CW tone. This shift will remain in effect until the rig comes out of transmit. Otherwise, it works just fine. If I send slow enough, it seems to not have any problems.

I haven't been able to reproduce the issue by using the straight key as the left or right side of the paddle - anything sent using the keyer seems to be on frequency reliably.

I'm thinking maybe switch bounce from the key? I have to get hold of a digital scope this week and am going to look at the switch closure; my scope just isn't fast enough to see anything of any help.

If there is any other information I can provide or anything else I can check to help others out with this issue, just let me know. Thanks again to all of those willing to make these radios even better.

-Jim, N9ZQA

3311. Re: [X1M_QRP-Transceiver] New firmware.

Jim,

Thank you so much for finding how to reproduce the issue. It will certainly be of benefit to everyone using CW, to know what to look at and which parameters to ask to be changed.

Dale is the CW expert on this radio, and has a digital scope, so I am sure as soon as he can find time he will look at the issue also.

My scope isn't fast enough either, so if you get an opportunity to look at it and we can send them a picture and details, they should be able to resolve the issue in fairly short order.

Your work is certainly appreciated. This has been a fantastic group effort on any matters related to this radio.

I for one, appreciate the contribution that each and every person has made in identifying and resolving any issues and in a timely manner.

Best 73, Charlie, W5COV

From: <kf4hou@...>
Topic: 3312 Message: 3312

I was noticing when testing out the radio that I sound very robotic into another receiver. I adjusted a little bit on the IF Offset and it seemed to make it sound better I also did adjust the frequency in 1hz steps , but the audio was always about the same robotic sounding but of course the tone was changing., I am not sure if I am doing the right thing or not, I wanted to make sure I am going down the right path.

There is a good description of how to set up the IF frequency and the other modes in the manual on the group web page. Be sure to get the IF set up correctly first and then make your other adjustments without changing the IF setting.

Hello all,

Heath, VK6TWO/VK2TWO the Aussie dealer for the X1M's must have set mine up pretty well before he shipped it out to me.

I just had my first ever amateur HF Northern Hemisphere contact and it was with EA3JE, Lou in Barcelona. My 1W out from the X1M into a 40m wire dipole at about 5 metres got me a 5/8 – 5/9 signal report, so I've got to be happy with that don't I? (~10,400miles or ~16,800Km) I'm only getting 1w out as I modified my tuner which dropped the power level from 4.5W to 1W... I'm about to unmodify it!

Hi Jim,
I think I understand what is going on. Apparently the Manual key input to the micro is not being given the same interrupt priority as is the internal keyer.
Never using a manual key, I did not see this. But it also explains why Victor is having an issue as he uses an external keyer and thus has the rig set to Manual keying.

Tnx,

Dale W4OP

Hi Victor,
I said that just to get you going. I wonder though if yours for some reason behaves differently than mine. It is not exactly like the keyer in my K3 or my Accukeyer, but I can send pretty effortlessly at 30-35 WPM with it.

☐

Hi Jim,
I think I understand what is going on. Apparently the Manual key input to the micro is not being given the same interrupt priority as is the internal keyer.

Never using a manual key, I did not see this. But it also explains why Victor is having an issue as he uses an external keyer and thus has the rig set to Manual keying.

Tnx,

Dale W4OP

Subject: Re: [X1M_QRP-Transceiver] New firmware.

Dale and all -

I am using the firmware from the above link (the files section of this group). I haven't had much chance to play with the radio this week, but I have been able to determine at least on my rig what seems to trigger the issue. I am using a straight key, wired as per the instructions, with the keyer set to "M". If I send a character beginning with a dit and the dit is short enough, the rig will transmit at a frequency shifted downward by the amount of the CW tone. This shift will remain in effect until the rig comes out of transmit. Otherwise, it works just fine. If I send slow enough, it seems to not have any problems.

I haven't been able to reproduce the issue by using the straight key as the left or right side of the paddle - anything sent using the keyer seems to be on frequency reliably.

I'm thinking maybe switch bounce from the key? I have to get hold of a digital scope this week and am going to look at th e switch closure; my scope just isn't fast enough to see anything of any help.

If there is any other information I can provide or anything else I can check to help others out with this issue, just let me know. Thanks again to all of those willing to make these radios even better.

-Jim, N9ZQA

3321. [X1M_QRP-Transceiver] Re: X1M pro LF/MF TX Test

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-30 16:39:48 UTC
From: Klaus
Topic: 2998 Message: 3321

Hello Hans,
only for making sure, i did understand it correctly:
Your diplexer has been inserted between X1M antenna connector and spectrum analyzer and you did NOT modify anything inside the transceiver?

In any case, your work will help all those who also are planning to "misuse" the X1M for LF band operation.
Maybe on occasion you also can tell us, how close your real capacitor values are compared to what has been calculated.

73 de Klaus, DJ7OO

3322. Internal keyer

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-12-30 16:52:36 UTC
From: Victor Schensnovich
Topic: 2534 Message: 3322

Dale, I tried internal keyer, but I can send now only dots or only dashes. I changed paddle - no result. Both paddles work ok with another keyer.
Victor, UA1CEX.

I too noticed the same problem as Jim. I was monitoring my CW on a Software Defined Radio using HDSDR allowing me to visually observe the signal a while in Manual Mode. I discovered the problem to be intermittent, sometimes it's spot on frequency but when I stop sending and go back to transmitting again, it may or may not go back to the dial frequency. I also noticed that when sending a rapid succession of dits, the frequency jumps up and down with every other dit being on the correct frequency. Really behaving erratically. I like using my MFJ keyer with Iambic Paddle but I also have a Vibroplex Vibrokeyer in Auto Mode. I will just continue to use the internal keyer until a resolution can be implemented.

Dale's root cause seems to me to be the likely culprit.

Yep, we thought this issue had been solved 2 firmware versions ago. Not having access to the code, it was not apparent that the straight key and internal keyer interrupts may have been treated differently.

Hi Klaus,
you understood it right, the diplexer is inserted between X1M and antenna.
No modification in the X1M!
As far as the caps are concerned, for each capacitor I used two in parallel and measured them for better than 1%.
The inducers I've calculated with "ringkern-rechner" and tested with L/C-meter from aade.
In this way theory and praxis are nearly identical, hi.

In the moment I am working on a PA with two IRFP 360 in parallel; in
class E they will provide more than 400 Watts. I hope that will be sufficient.

Hi Victor,
I am now wondering if there is a mechanical issue with your key jack. When you say all dashes or all dots- I am thinking one or the other depending on whether you have AR or AL set up. Try this test:
Plug in just your paddle with "M" for the Key type selected. Can you make dashes (or whatever) from both the dot and dash side?

Yep, that was the conclusion I was coming to also. At some point, we are going to have to locate some more reliable connectors to the outside world.
You might first confirm that it is not a broken solder joint though. Early on I epoxied the connectors (neatly) to the PCB board so that mechanical strain could not dislodge the solder tabs to the PCB. I guess I am old school, but I still like connectors that fasten onto the panel with a flatwasher and nut.

Manual key works ok, but when I choose AR or AL, keyer send only dots or dashes. I thought, maybe, it is a paddle problem, but two paddles do the same. Maybe, it is my own problem.

I did the upgrade from the user group. I tried everything I could think of to replicate Victors issue, all keyer/manual modes with a variety of keys(straight, paddle, ect..) and changing CW tone without success.
My upgrade went flawless without any bugs.

Yep, that was the conclusion I was coming to also. At some point, we are going to have to locate some more reliable connectors to the outside world.
You might first confirm that it is not a broken solder joint though. Early on I epoxied the connectors (neatly) to the PCB board so that mechanical strain could not dislodge the solder tabs to the PCB. I guess I am old school, but I still like connectors that fasten onto the panel with a flatwasher and nut.

☐

Hi Victor,
I am now wondering if there is a mechanical issue with your key jack. When you say all dashes or all dots- I am thinking one or the other depending on whether you have AR or AL set up. Try this test:
Plug in just your paddle with "M" for the Key type selected. Can you make dashes (or whatever) from both the dot and dash side?

Hi folks, I hope this adds something to the discussion... here is what I get... first I am using an X1M pro with the if offset = cw BFO. My CW tone is 700 Hz. I have a MFJ iambic keyer and the Nov 20th firmware. I connected the X1M to a dummy load and observed the CW mode output on a nearby (antenna-less) SDR display. I'll post pictures of the waterfall. The first dit, whether the keyer is used in manual or AR mode, is a split signal with part of the RF on the transmit frequency (7.105 MHz in my case) and part 700 Hz lower (see picture a). They appear to be of similar intensity (pic b). This does not occur again while TX mode is maintained (pic c). If the unit is allowed to go back to RX mode, the first subsequent TX dit (or dah) is again split. The same thing happens with first dashes, but the effect is less noticeable since only the first part of the dash is split (and attenuated) (pic a). A series of dits or dahs (15 WPM) shows a splitting of the earliest part of the transmission (see pic c). As you can see, the first "on frequency" dit intensity (RF power) seems significantly attenuated by the frequency splitting. Maybe this is Victor's lost dit?

Making a lot of RF power in LF bands should not be a big problem,
but its optimal radiation could be a different story.

OK, here is what happened after reloading the Nov firmware and then the Dec firmware... Reloading the Nov firmware did not change the attenuation and splitting of the very early part of a CW transmission, as has been seen in pictures a, b and c. I then loaded the Dec firmware update and the early transmission frequency splitting was gone, although the strength of the first dit still seemed a bit attenuated (not really quantified, just a judgement). BUT, now as you can see in picture "d", the transmission frequency seemingly randomly shifts from the one set (7.105 MHz) to one down 700 Hz. This only happens when the keyer is set to manual mode and I "flail" a bit on the keyer. A long steady carrier transmission usually comes out on the right frequency. But if I flutter on the keyer, pause for a RX reset, and then flutter some more there is often a -700 Hz shift in the TX frequency. It is a very reliable effect and as you can see from picture d, I could make the TX alternate between the two frequencies. It did not always alternate however. If the keyer was in AR or AL mode, I could not cause the TX shift no matter how high I set the WPM speed. When in manual mode, either side of my iambic keyer (either paddle) could initiate the shift if "fluttered" (one paddle goes to the tip and one to the collar of the keyer jack). At least it is reproducible! Lee KF7YRS

Failures CW Straight manipulator.
This is a summary of my experience with straight failures manipulator with December 2013 firmware

With straight hey some pulses are transmitted without frequency offset (eg 800Hz).
This occurs randomly many times.
So often it is impossible to work in CW with a straight key.

Important:
- While in the menu "SETTINGS" seems to work wel ¿?
- Must be emphasized that CW with Time Delay very low (eg 050), the problem seems to decrease a lot or almost disappears.

Salvador

---In X1M_QRP-Transceiver@yahoogroups.com, <lphebus@...> wrote:

OK, here is what happened after reloading the Nov firmware and then the Dec firmware... Reloading the Nov firmware did not change the attenuation and splitting of the very early part of a CW transmission, as has been seen in pictures a, b and c. I then loaded the Dec firmware update and the early transmission frequency splitting was gone, although the strength of the first dit still seemed a bit attenuated (not really quantified, just a judgement). BUT, now as you can see in picture "d", the transmission frequency seemingly randomly shifts from the one set (7.105 MHz) to one down 700 Hz. This only happens when the keyer is set to manual mode and I "flail" a bit on the keyer. A long steady carrier transmission usually comes out on the right frequency. But if I flutter on the keyer, pause for a RX reset, and then flutter some more there is often a -700 Hz shift in the TX frequency. It is a very reliable effect and as you can see from picture d, I could make the TX alternate between the two frequencies. It did not always alternate however. If the keyer was in AR or AL mode, I could not cause the TX shift no matter how high I set the WPM speed. When in manual mode, either side of my iambic keyer (either paddle) could initiate the shift if "fluttered" (one paddle goes to the tip and one to the collar of the keyer jack). At least it is reproducible! Lee KF7YRS

3347. Internal keyer

Hi Dale. I have a question. What is a 5 dots spacing??? In electronic keyer all spacing has to be 1 dot. And it does not matter between what. And than this keyer will start to work like all other keyers.

73/72 - Victor, UA1CEX.

I am not sure what you are referring to Victor. The only thing that comes to mind is that the spacing between elements is a single dot length, while the ideal spacing between words is 5 dot lengths (from memory).

I think letter spacing is 3 dot lengths- which apparently, the X1M keyer forces. My Accukeyer has this also- I normally do not use it, preferring to depend upon my own timing. But I have adjusted to the X1M. Maybe not for the CW purist.

I detect that spacing only when the previous Morse character ends in a dot. As an example, sending DE- I can feel the forced letter spacing. This may be an artifact of the Dot Memory I requested. We could ask if they can eliminate Dot Memory as it is not nearly as important as Dash Memory, but I fear there could be other collateral casualties as result of the language barrier.

I have added 3 photos to my "Version 3 Board" album. These photos show the completed S/RF meter housing. This housing mounts under the front of the radio and also contains the speech processor circuit and tune button.
The housing is made from copper circuit board material and places the radio on a comfortable viewing angle.

Dale, when I sent a letter, I cannot send next one, because I have to wait 5 dots spacing. And this delay after each letter. It is not normal!

73/72 - Victor, UA1CEX.

□

I am not sure what you are referring to Victor. The only thing that comes to mind is that the spacing between elements is a single dot length, while the ideal spacing between words is 5 dot lengths (from memory).

Subject: [X1M_QRP-Transceiver] Internal keyer

Hi Dale. I have a question. What is a 5 dots spacing??? In electronic keyer all spacing has to be 1 dot. And it does not matter between what. And than this keyer will start to work like all other keyers.

73/72 - Victor, UA1CEX.

Dale, yes, if you can do your own timing it is what we need. But really, Chinese can do something wrong again. I installed now Nov. firmware. And now everything is ok. But first dot is shorter than others.

73/72 - Victor, UA1CEX.

☐

I think letter spacing is 3 dot lengths- which apparently, the X1M keyer forces. My Accukeyer has this also- I normally do not use it, preferring to depend upon my own timing. But I have adjusted to the X1M. Maybe not for the CW purist.

I detect that spacing only when the previous Morse character ends in a dot. As an example, sending DE- I can feel the forced letter spacing. This may be an artifact of the Dot Memory I requested. We could ask if they can eliminate Dot Memory as it is not nearly as important as Dash Memory, but I fear there could be other collateral casualties as result of the language barrier.
